

EASC2410 Lecture 8

# Python Basics: Data on Maps

Dr. Binzheng Zhang  
Department of Earth Sciences

## Review of Lecture 7

**In Lecture 7, we learned:**

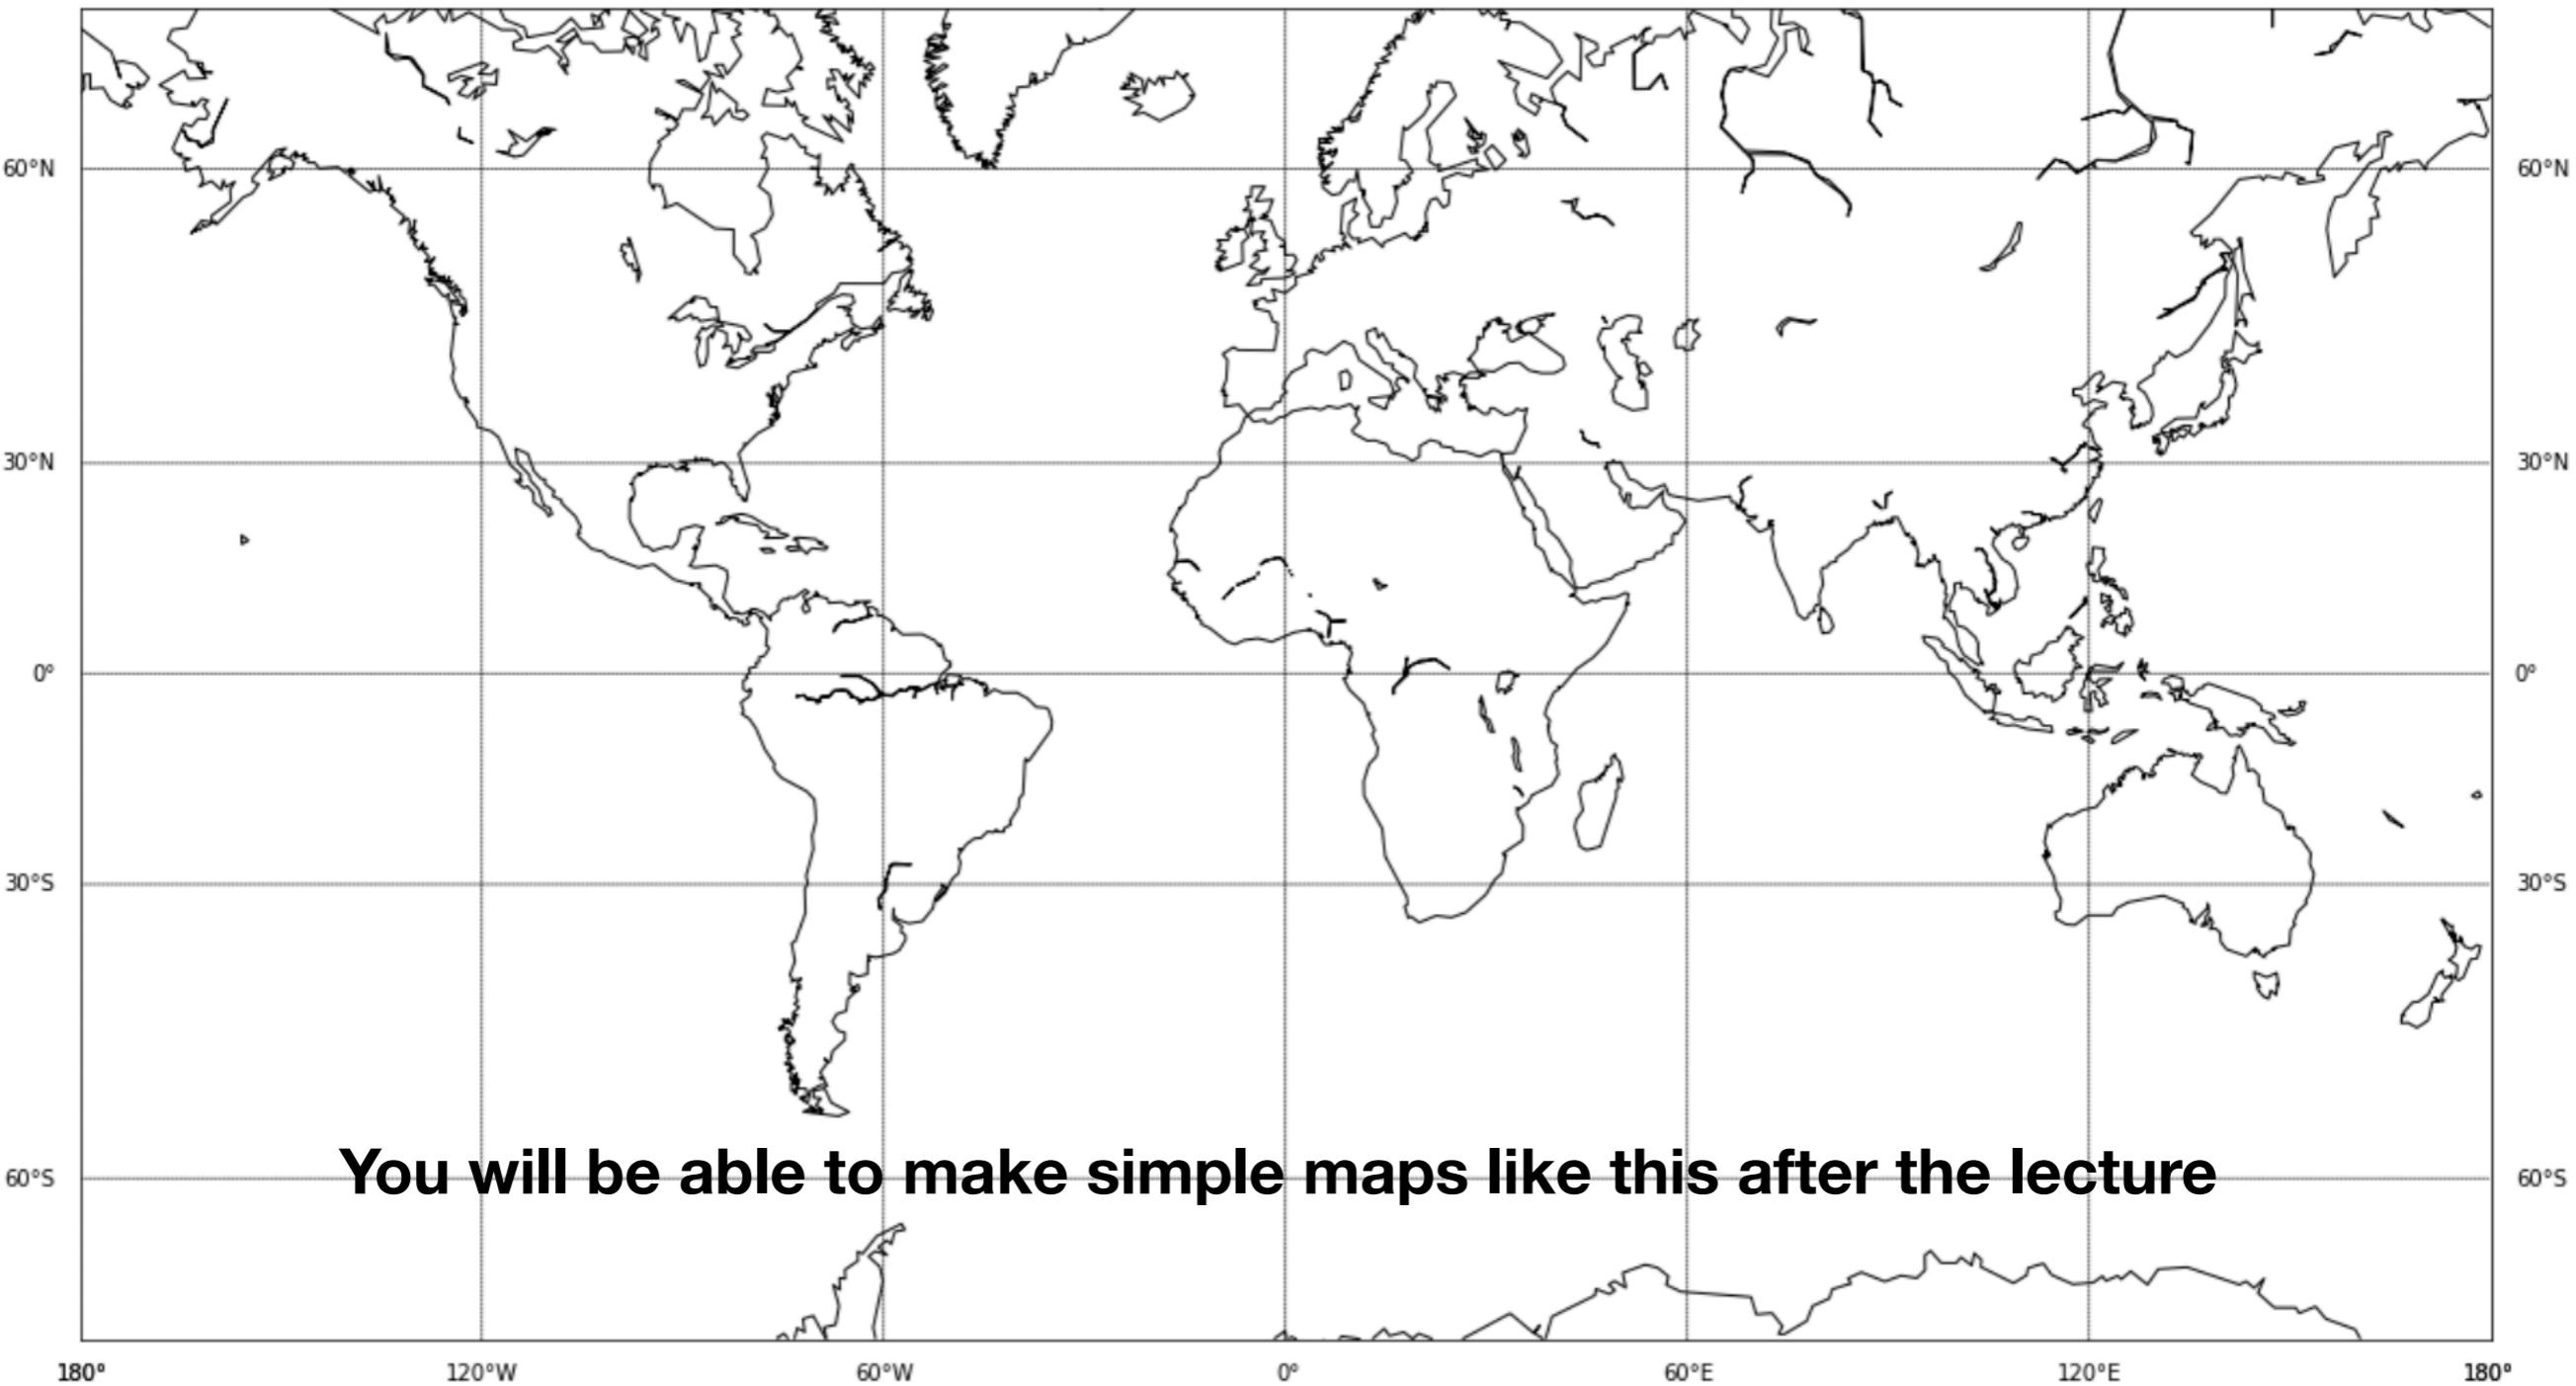

- **2-D NumPy arrays**
- **Index slicing of 2-D arrays**
- **Load data into Python using `loadtxt()` and `genfromtxt()`**
- **Visualize your data**

**In Lecture 8, you will learn:**

- **Creating maps using the *basemap* module**
- **plotting spatial data points on your maps**

## What is a map?

A map is basically a **projection** tries to represent something that is essentially 3D (a globe) onto a 2D medium (a paper or a computer screen). So all maps, except those at the smallest scale, will increasingly distort the area as the scale increases because the Earth is not flat.

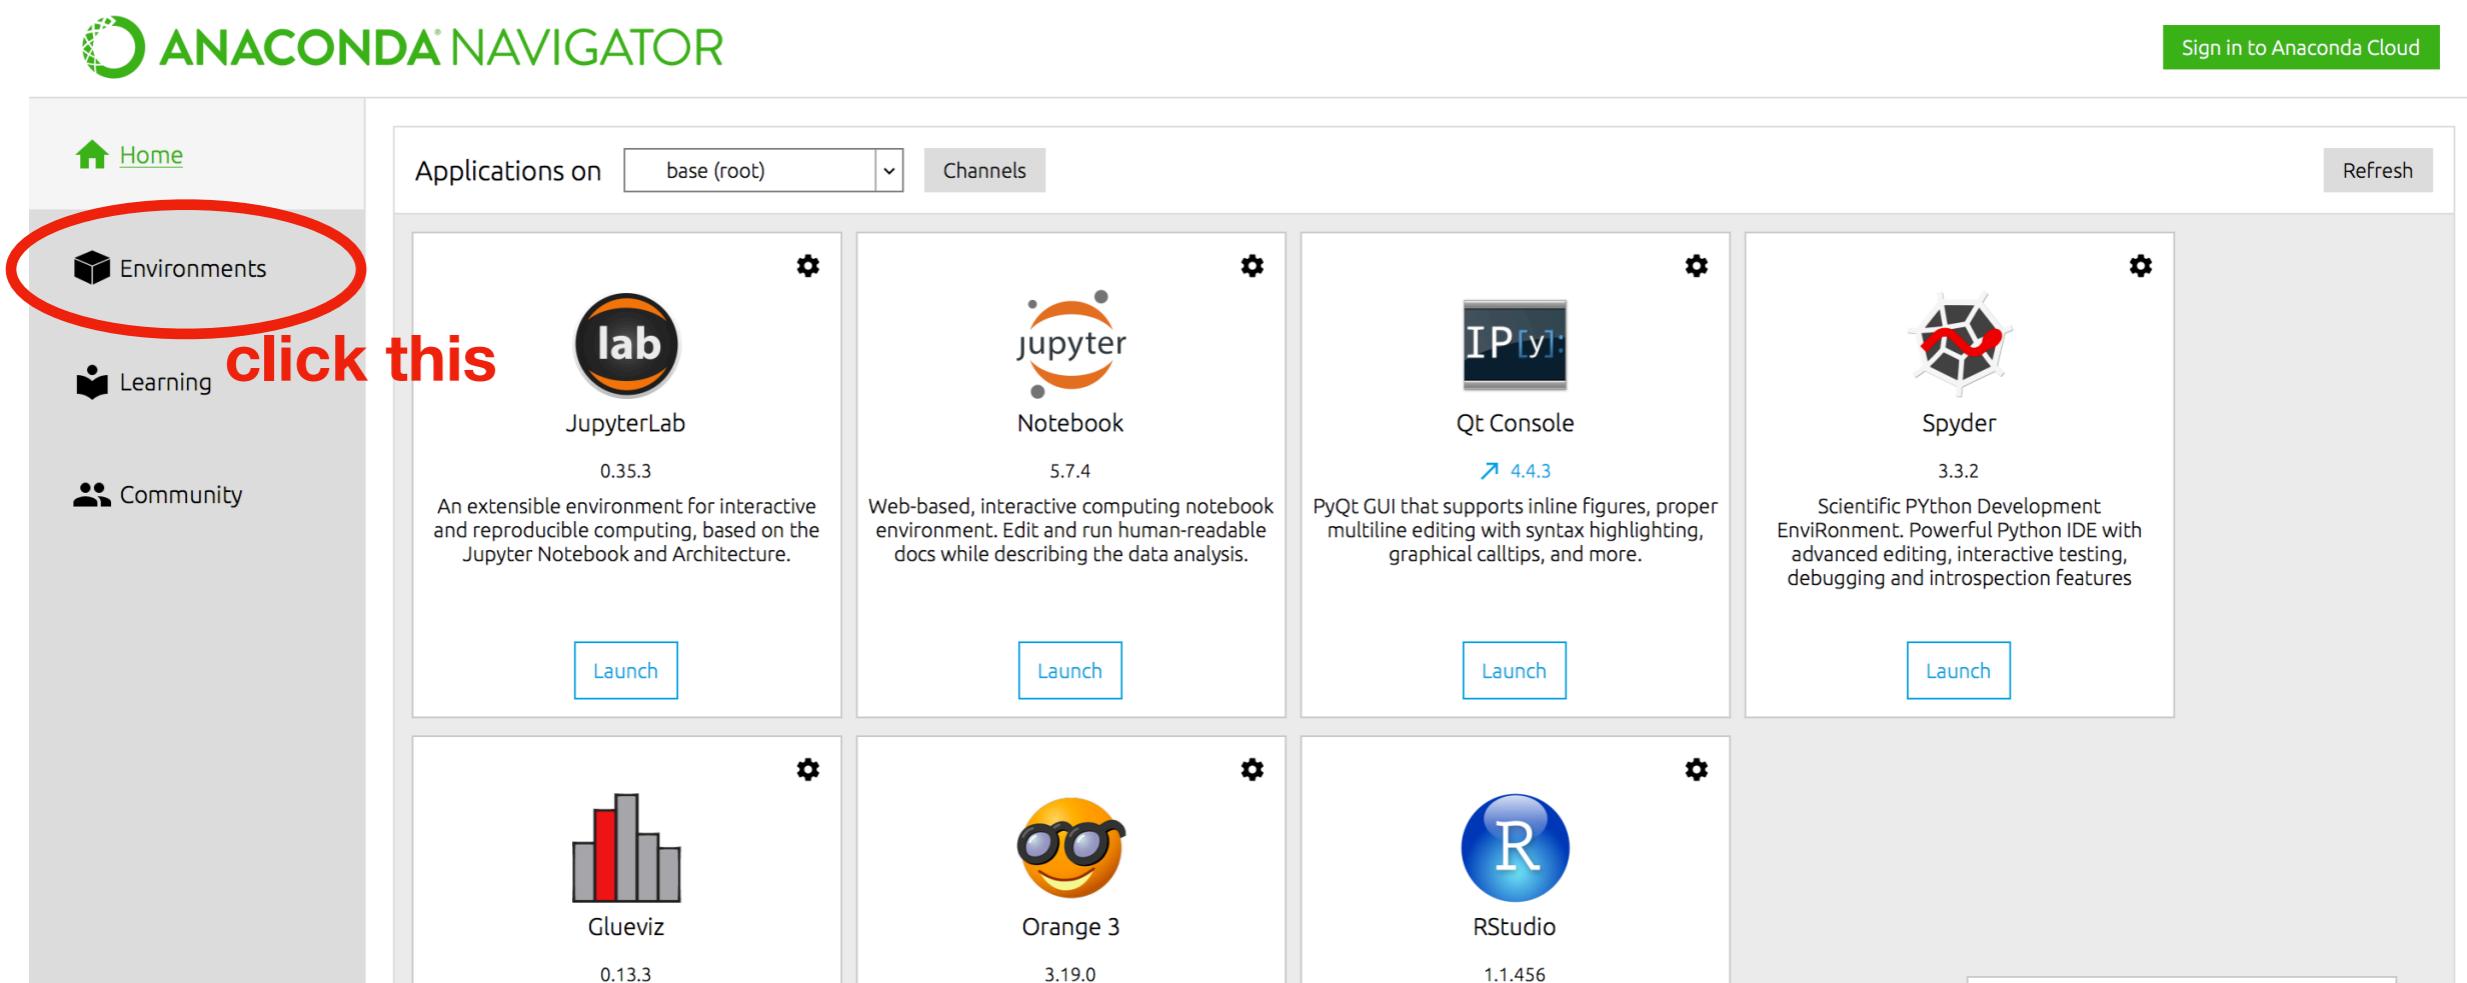

# How to make maps in Python?

There are many ways to make maps in Python. In this course, our maps in Python are plotted using the tools in **matplotlib**'s **Basemap** module. So the first thing we need to do is install the **basemap** module in *anaconda*:

## Why we need to “install” basemap?

We have used modules in the previous practices and homework assignments, such as **math**, **numpy** and **matplotlib**. Why we didn't need to install these libraries? **Because Anaconda has already done that for you!**

# Check modules that are already installed

select this

The screenshot shows the Anaconda Navigator interface. The left sidebar includes links for Home, Environments, Learning, Community, Documentation, and Developer Blog, along with social media icons for Twitter, YouTube, and GitHub. The main area has tabs for 'Installed' (circled in red), 'Channels', 'Update index...', and 'Search Packages'. Under 'base (root)', there are environments 'gmt-python' and 'pygmt'. The 'Installed' tab shows a list of packages with columns for Name, Description, and Version. The 'numpy' package is highlighted with a blue selection bar and the text "numpy" is already installed overlaid. Other packages listed include nose, notebook, numba, numexpr, numpy-base, numpydoc, odo, olefile, openjpeg, openpyxl, openssl, packaging, pandas, and pandoc.

Name	Description	Version
nose	Nose extends unittest to make testing easier	1.3.7
notebook	Jupyter notebook	5.7.4
numba	Numpy aware dynamic python compiler using llvm	0.39.0
numexpr	Fast numerical expression evaluator for numpy.	2.6.8
<b>numpy</b>	Array processing for numbers, strings, records, and objects.	1.15.4
numpy-base		1.15.4
numpydoc	Sphinx extension to support docstrings in numpy format	0.8.0
odo	Data migration in python	0.5.1
olefile	Parse, read and write microsoft ole2 files	0.46
openjpeg	An open-source jpeg 2000 codec written in c	2.3.0
openpyxl	A python library to read/write excel 2010 xlsx/xlsm files	2.5.12
openssl	Openssl is an open-source implementation of the ssl and tls protocols	1.1.1a
packaging	Core utilities for python packages	18.0
pandas	High-performance, easy-to-use data structures and data analysis tools.	0.24.0
pandoc	Universal markup converter (repackaged binaries).	1.19.2.1

You can also find that a fairly large amount of modules are already installed, such as matplotlib, pandas, etc.

# So, How to “install” basemap? - it’s relatively easy in Anaconda

Step 1: Select the “Not installed” option from the first drop-down menu

**select this**

**type in “basemap”**

The screenshot shows the Anaconda Navigator interface. On the left, there's a sidebar with icons for Home, Environments, Learning, Community, Documentation, and Developer Blog. Below the sidebar are social media links for Twitter, YouTube, and GitHub. The main area is titled "ANACONDA NAVIGATOR" and has a "Search Environments" bar. A dropdown menu is open, with "Not installed" highlighted and circled in red. To the right of the dropdown is a "Search Packages" bar with a magnifying glass icon, which is circled in green. The main pane displays a list of packages with columns for Name, Version, and Description. The "Name" column includes checkboxes. The "Description" column contains brief descriptions of each package. At the bottom of the main pane, it says "1568 packages available".

Name	Description	Version
_mutex_mxnet		0.0.40
_nb_ext_conf		0.4.0
_py-xgboost-mutex		2.0
_r-mutex		1.0.0
_r-xgboost-mutex		2.0
_tflow_1100_select		0.0.2
_tflow_190_select		0.0.3
_tflow_select		2.3.0
abseil-py	Abseil python common libraries, see <a href="https://github.com/abseil/abseil-py">https://github.com/abseil/abseil-py</a> .	0.7.0
abstract-rendering		0.5.1
aenum	Advanced enumerations (compatible with python's stdlib enum), namedtuples,	2.1.2
affine	Matrices describing affine transformation of the plane.	2.2.2
agate	A data analysis library that is optimized for humans instead of machines.	1.6.1
agate-dbf	Agate-dbf adds read support for dbf files to agate.	0.2.0
agate-excel	Agate-excel adds read support for excel files (xls and xlsx) to agate.	0.2.2
agate-sql	Agate-sql adds sql read/write support to agate.	0.5.3

# So, How to “install” basemap? - it’s relatively easy in Anaconda

Step 2: Tick the “**basemap**” and click apply

The screenshot shows the Anaconda Navigator web interface. On the left is a sidebar with icons for Home, Environments, Learning, and Community, along with links to Documentation and Developer Blog. At the bottom are social media links for Twitter, YouTube, and GitHub, and navigation buttons for Create, Clone, Import, and Remove.

The main area has a search bar at the top labeled "Search Environments". Below it, a dropdown menu shows "Not installed" with a dropdown arrow, and a search input field containing "basemap" with a clear button. There are also "Channels" and "Update index..." buttons.

A red box highlights the "base (root)" environment, with the text "Tick here" overlaid. Another red circle highlights the checked checkbox for the "basemap" package in the list below. The list includes:

Name	Description	Version
<input checked="" type="checkbox"/> basemap	Plot on map projections using matplotlib	1.2.0
<input type="checkbox"/> basemap-data-hires		1.2.0

At the bottom right, a red box highlights the "Apply" button, with the text "Click ‘Apply’" overlaid. The status bar at the bottom indicates "2 packages available matching ‘basemap’" and "1 package selected".

## So, How to “install” basemap? - it’s relatively easy in Anaconda

Step 3: Wait and let Anaconda does it's own job...

### How to use basemap?

For most of the users you should be able to use the basemap module using the following codes (note that numpy and matplotlib is also needed to make maps):

```
In [ ]: import numpy as np # import numpy
import matplotlib.pyplot as plt # import pyplot
from mpl_toolkits.basemap import Basemap # import basemap module using this syntax!
```

Some users may have problem with the \$PATH for the pyproj library, so you might need to use the following code to load the basemap module (it's not the best way to resolve the problem, but it's an easy way to get your computer working properly with basemap!)

```
In [1]: import numpy as np # import numpy
import matplotlib.pyplot as plt # import pyplot

import os # build-in module OperatingSystem
os.environ['PROJ_LIB'] = '<path of your Anaconda>/share/proj' # setting the environment path for basemap

from mpl_toolkits.basemap import Basemap # import the basemap module using this syntax!
```

Now let's create maps!

## Basic Syntax of creating maps using basemap

```
m = basemap(Projection, [Options])
```

```
m.drawcoastlines()
```

m is an object of basemap class (just regard it as a map named “m”)

basemap() is the function that creates a map object

the keyword “Projection” tells basemap what kind of map you want

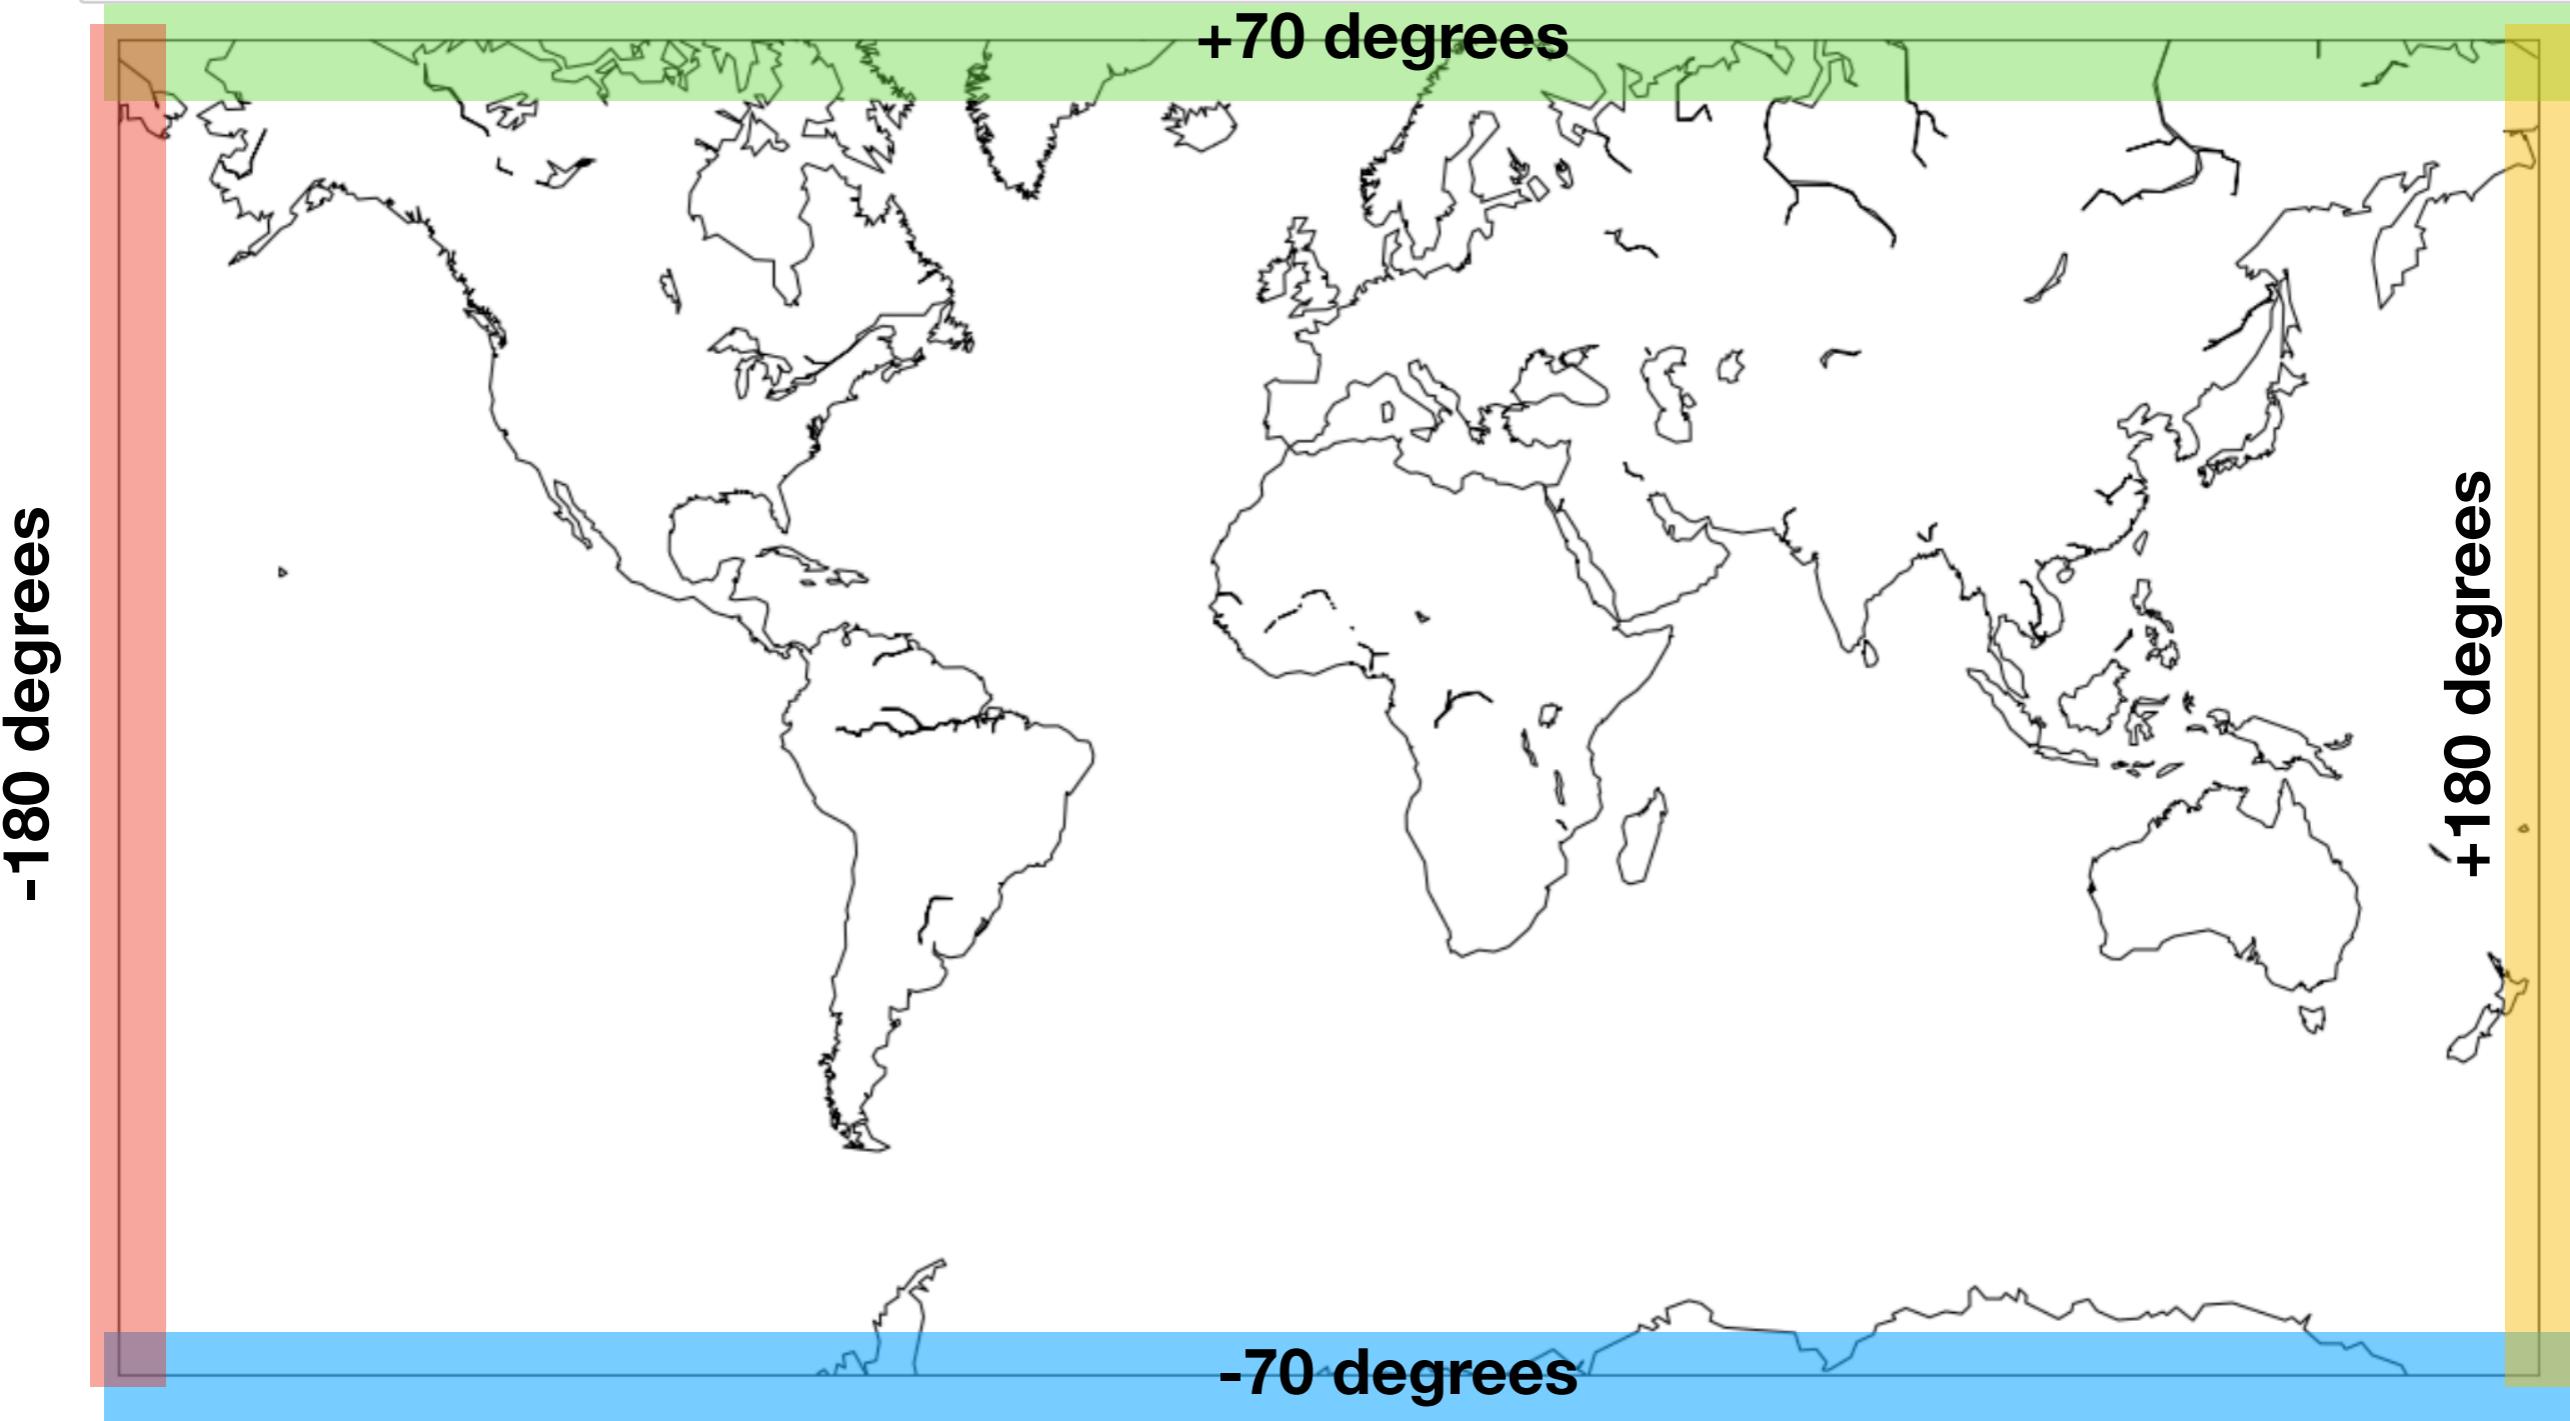

Various options specify the style, label, colors etc of the map

drawcoastlines() function put on the coast lines so you can see a map

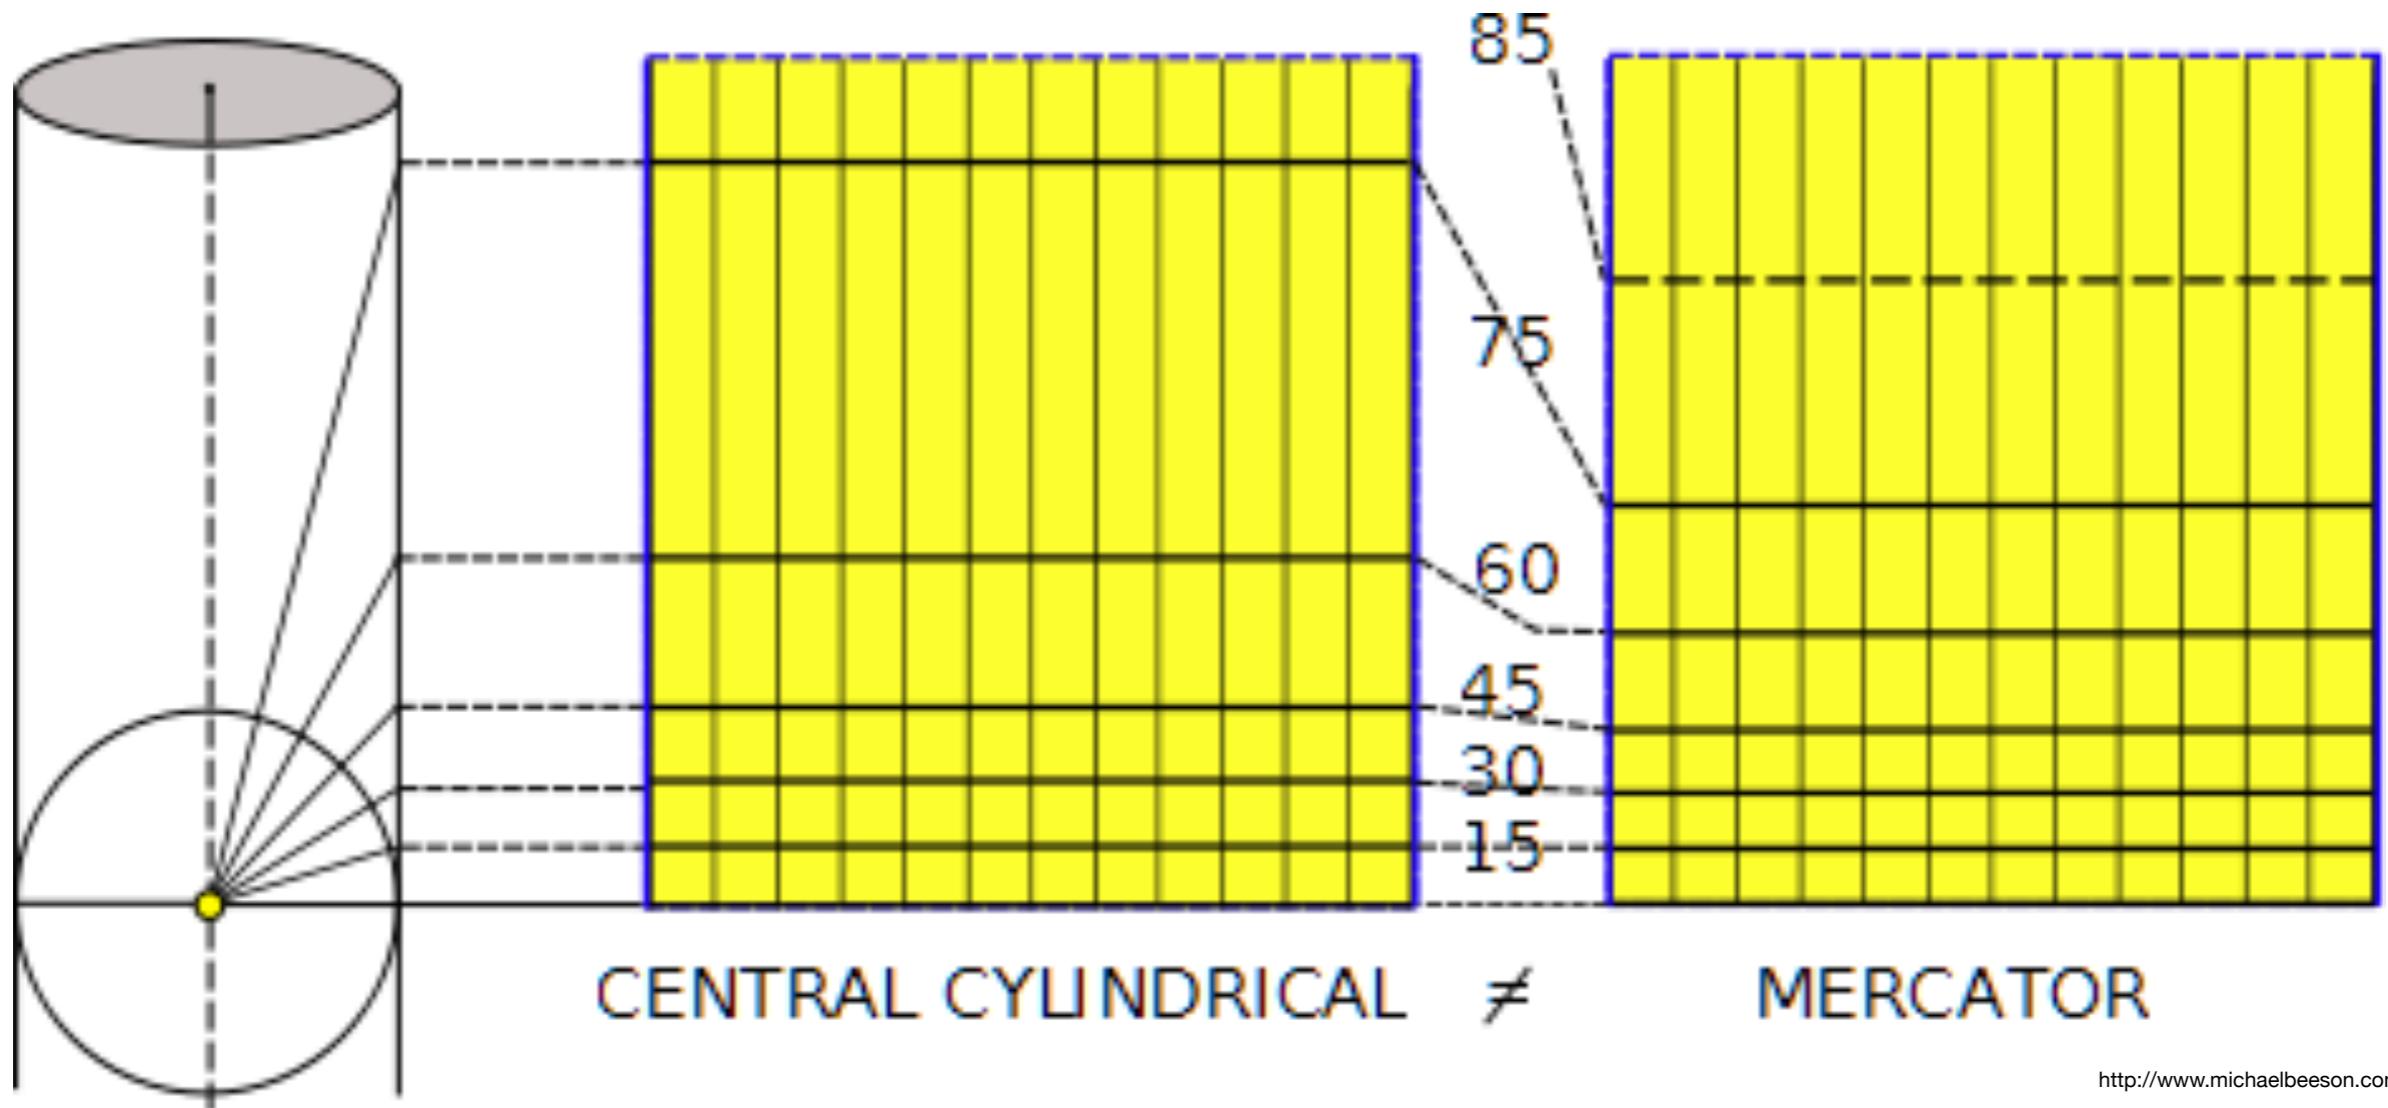

## Mercator Projection of the world map (merc)

```
In [3]: plt.figure(figsize=(20,15)) # create a new figure with size (16,15)
```

```
# make a map instance called 'm', pay attention to the boundaries of the map
m = Basemap(projection='merc',llcrnrlat=-70,urcrnrlat=70,llcrnrlon=-180,urcrnrlon=180)
m.drawcoastlines(); # put on the coastlines
plt.show() # show your map!
```

## Mercator Projection of the world map

- The most popular projection of maps
- Less distortion in mid and low latitude regions
- Large distortion in high latitude regions (see Iceland)

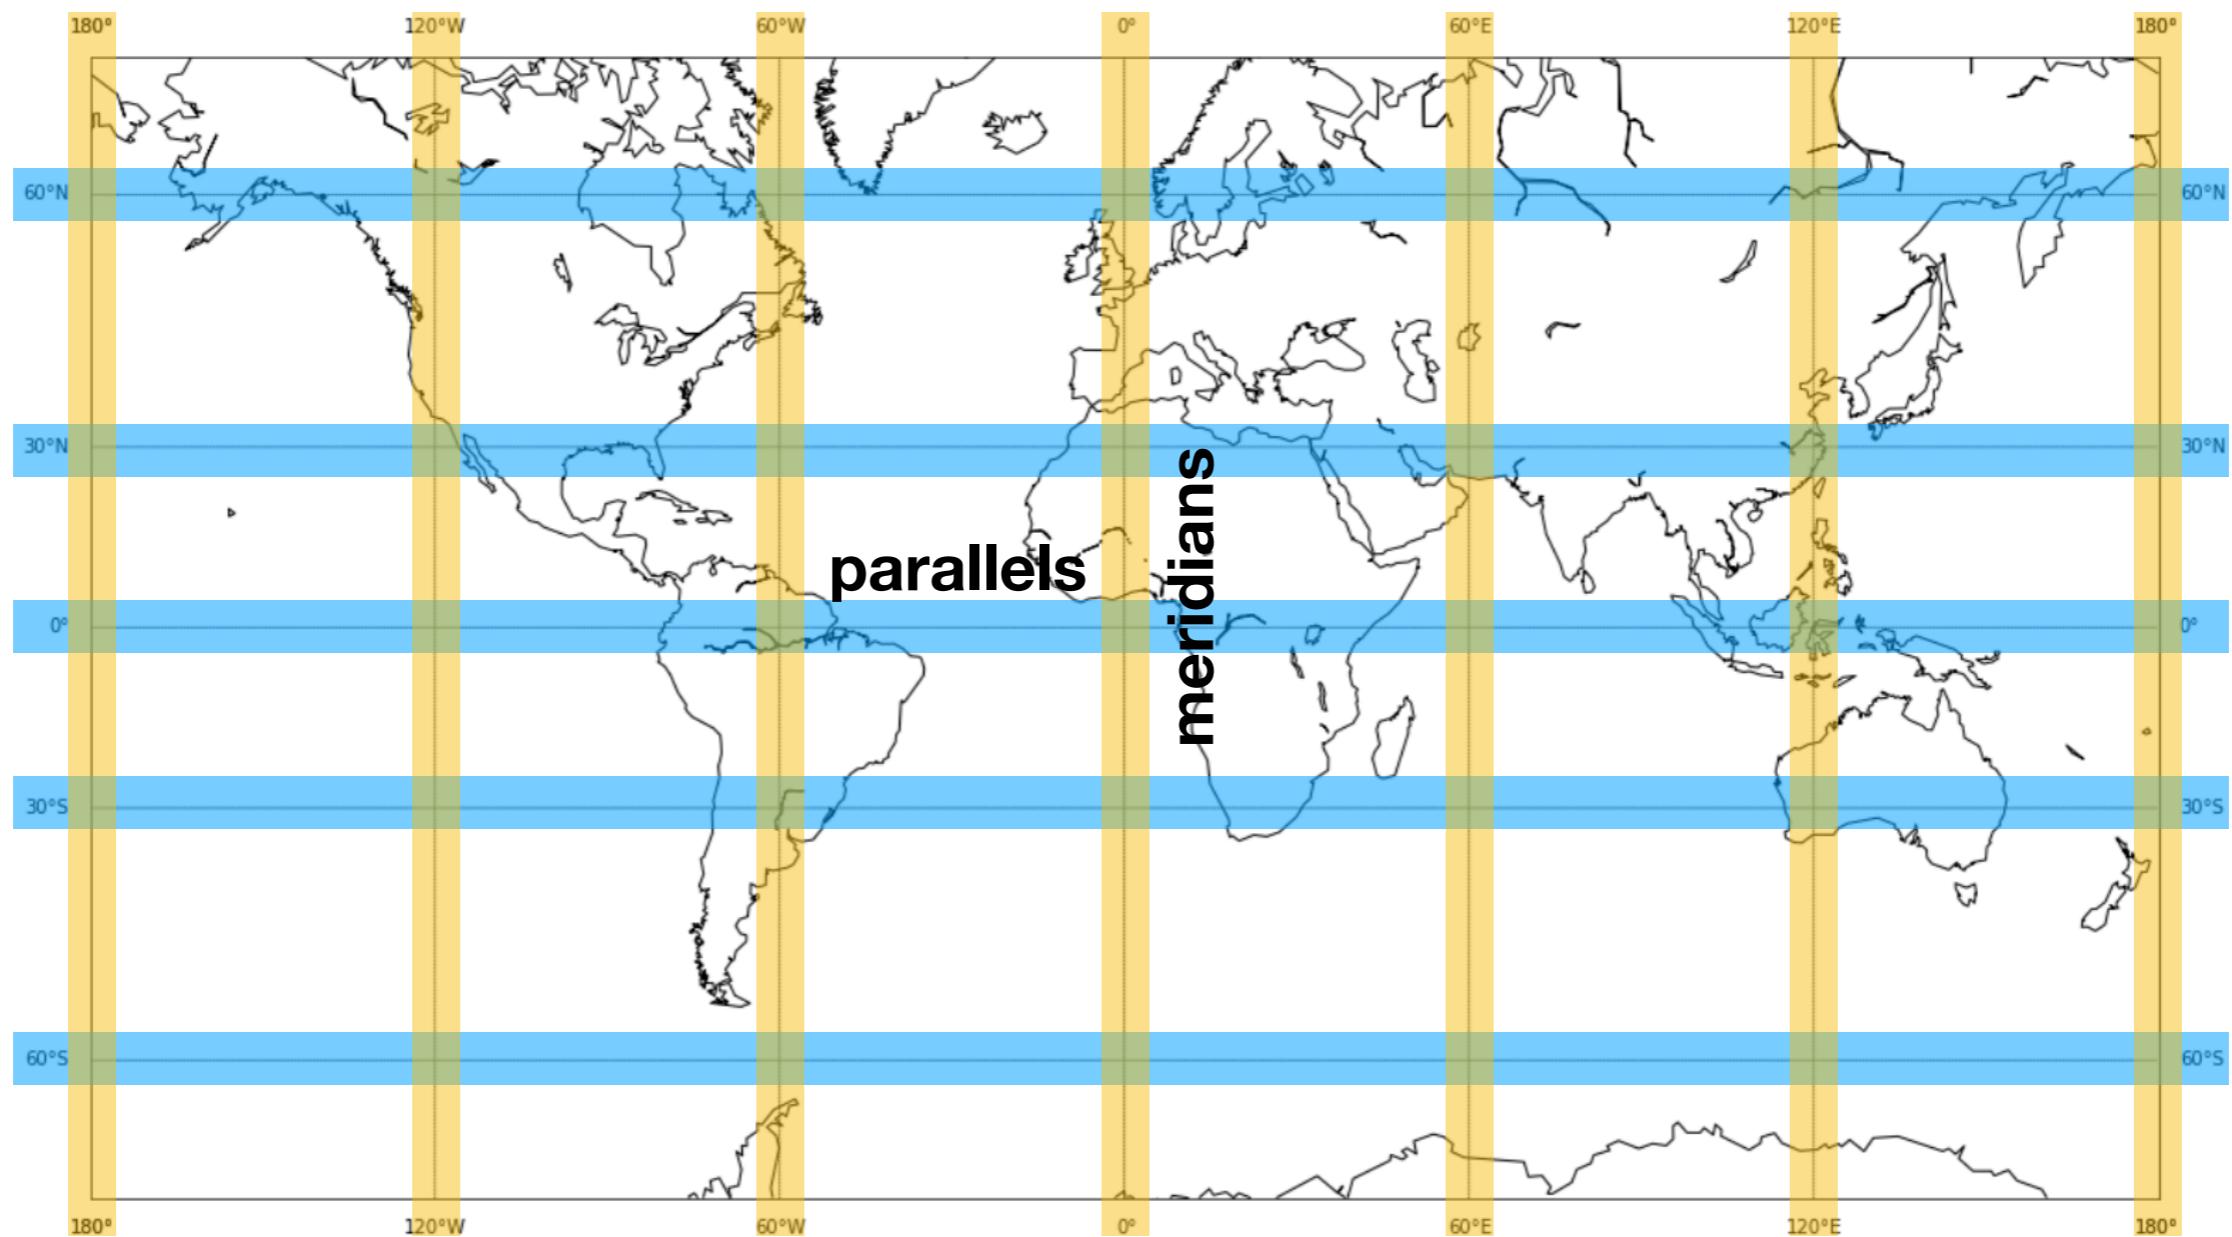

## Label your maps

```
In [6]: plt.figure(figsize=(20,15)) # create a new figure with size (16,15)

# make a map instance called 'm', pay attention to the boundaries of the map
m = Basemap(projection='merc',llcrnrlat=-70,urcrnrlat=70,llcrnrlon=-180,urcrnrlon=180)
m.drawcoastlines() # put on the coastlines

m.drawparallels(np.arange(-90.,91.,30.), labels=[True,True,False,False]) # plot the latitudes
m.drawmeridians(np.arange(-180.,181.,60.),labels=[False,False,True,True]); # same for longitude

plt.show() # show your map!
```

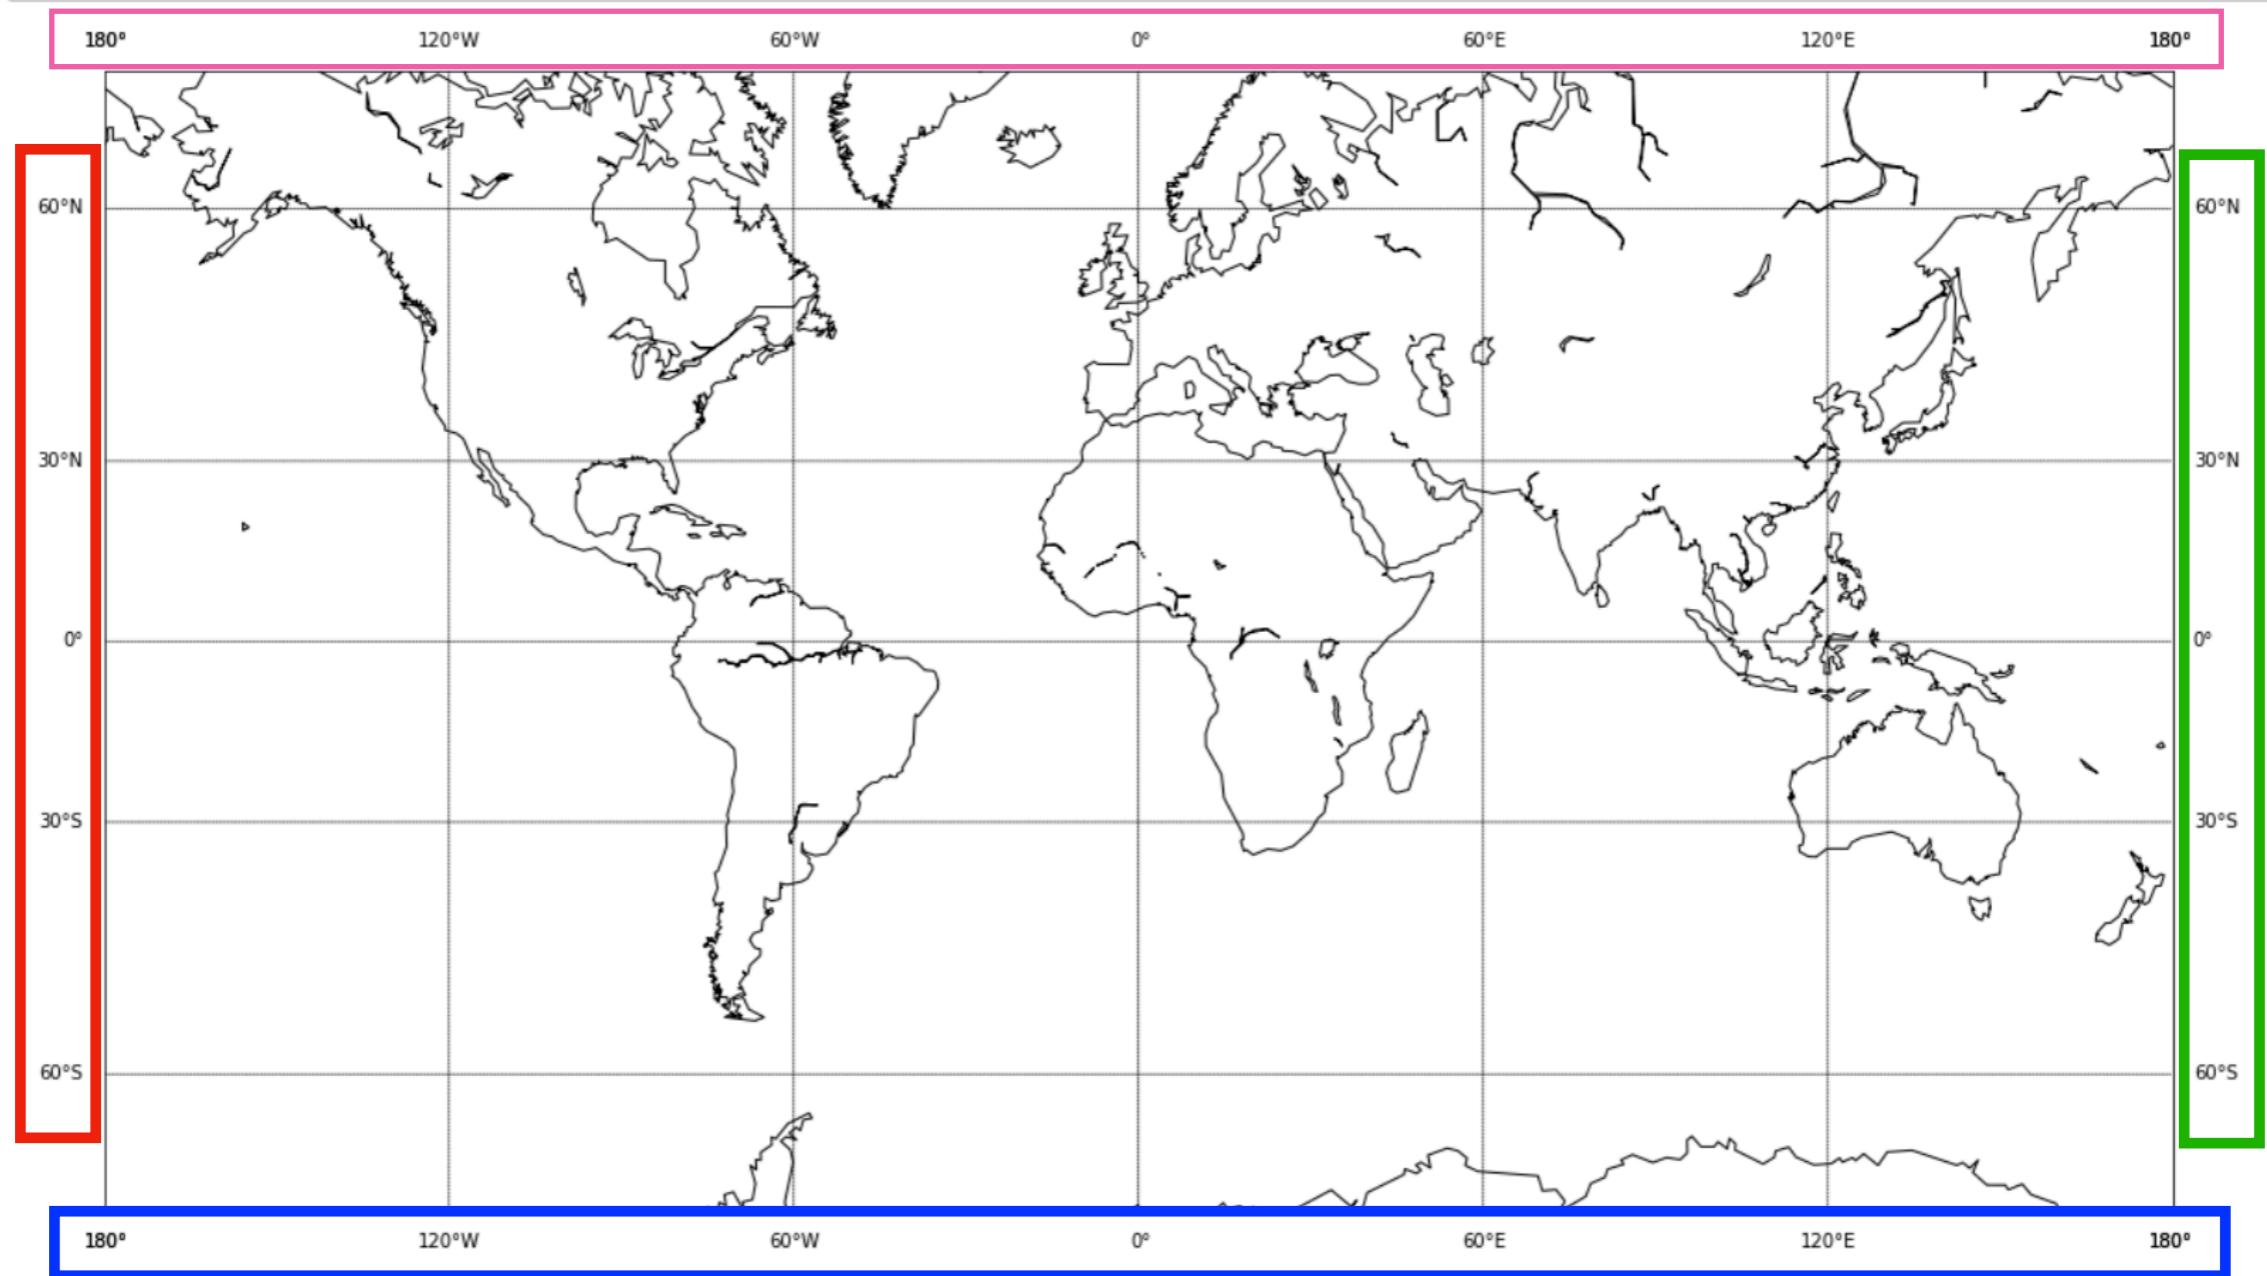

## Label your maps

```
In [6]: plt.figure(figsize=(20,15)) # create a new figure with size (16,15)
```

```
# make a map instance called 'm', pay attention to the boundaries of the map
m = Basemap(projection='merc',llcrnrlat=-70,urcrnrlat=70,llcrnrlon=-180,urcrnrlon=180)
m.drawcoastlines() # put on the coastlines

m.drawparallels(np.arange(-90.,91.,30.), labels=[True, True, False, False]) # plot the latitudes
m.drawmeridians(np.arange(-180.,181.,60.),labels=[False, False, True, True]); # same for longitude

plt.show() # show your map!
```

## Color your maps

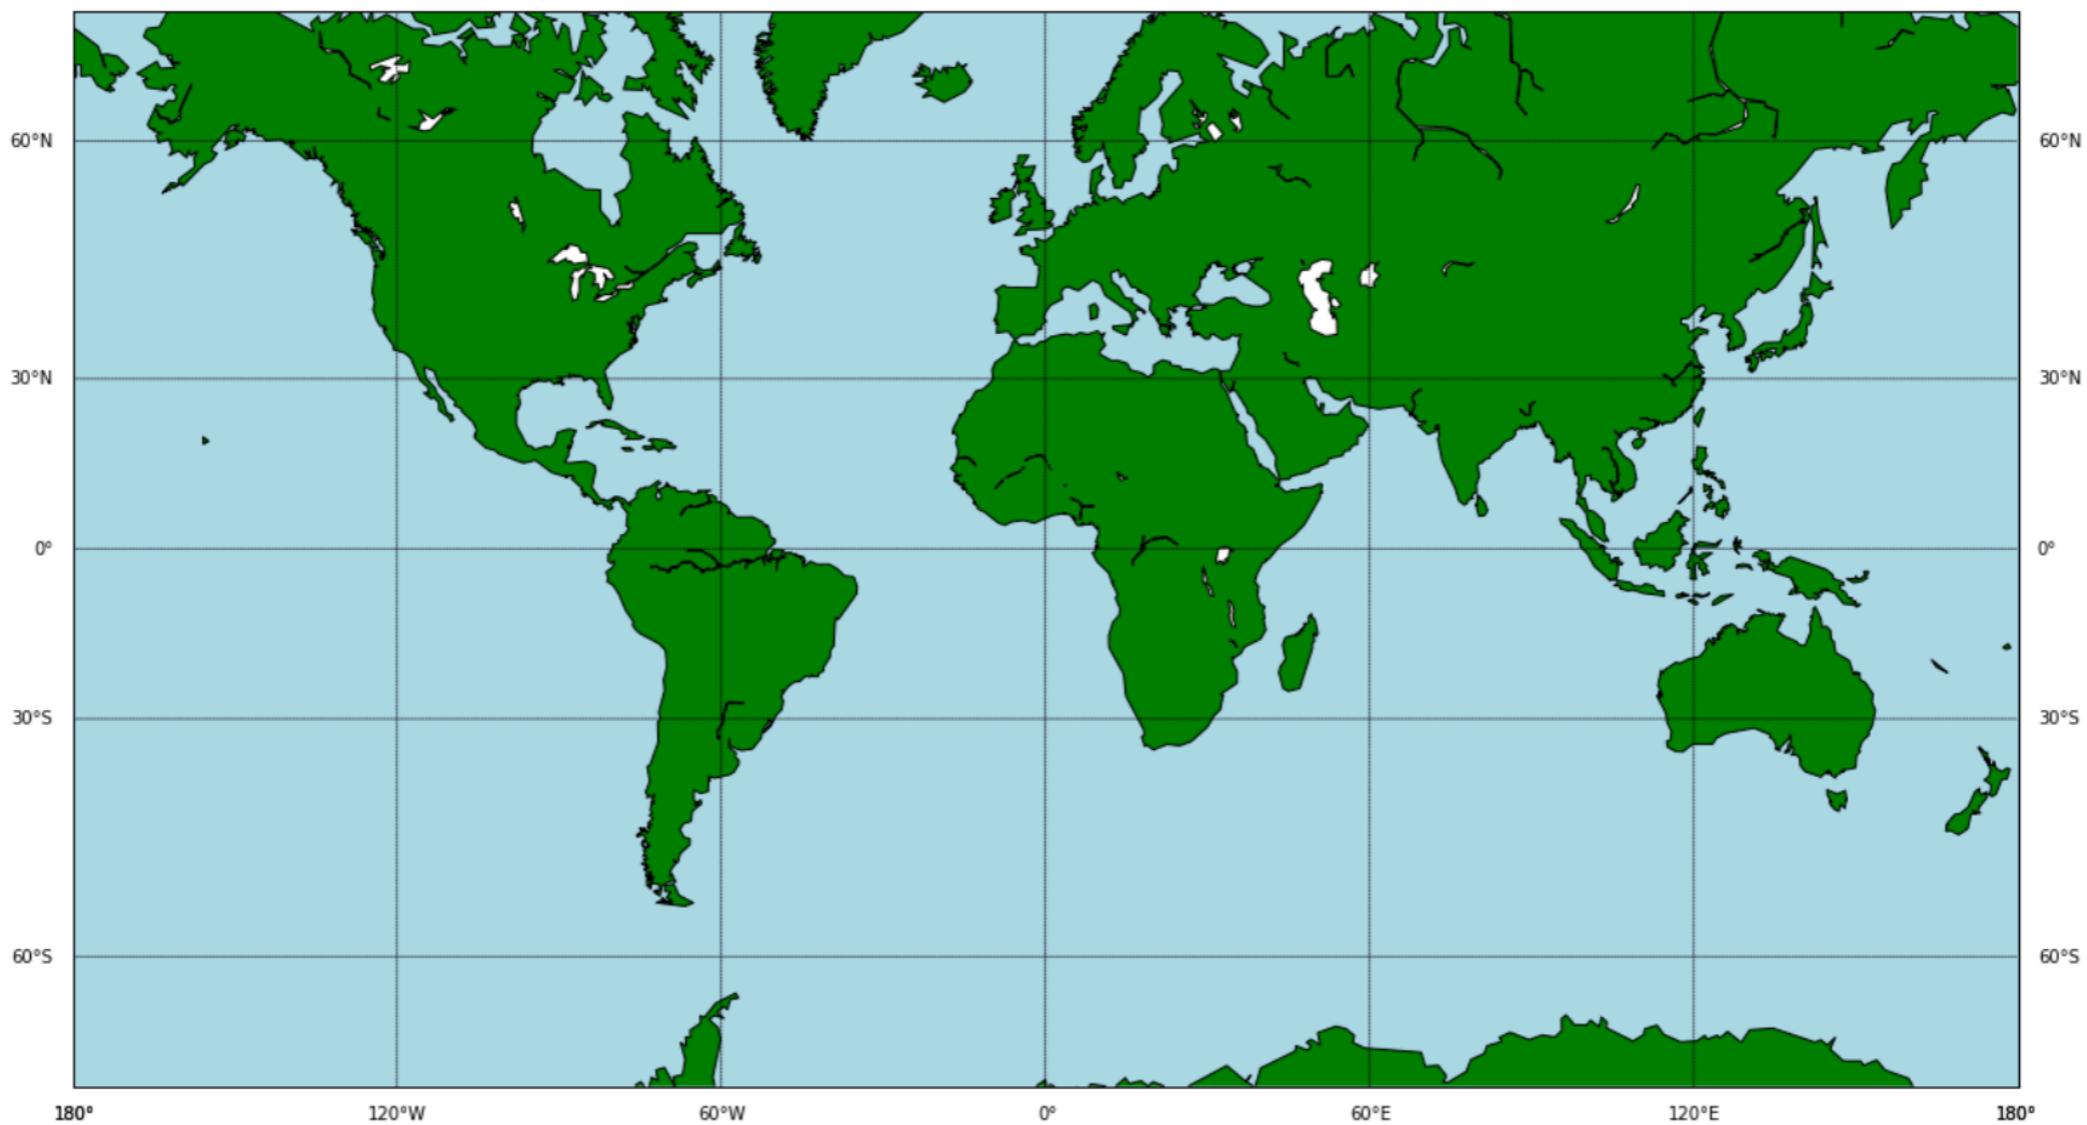

```
In [7]: plt.figure(figsize=(20,15)) # create a new figure with size (16,15)

# make a map instance called 'm', pay attention to the boundaries of the map
m = Basemap(projection='merc',llcrnrlat=-70,urcrnrlat=70,llcrnrlon=-180,urcrnrlon=180)
m.drawcoastlines(); # put on the coastlines

m.drawparallels(np.arange(-90.,91.,30.), labels=[True,True,False,False]) # plot the latitudes (
m.drawmeridians(np.arange(-180.,181.,60.),labels=[False,False,False,True]); # same for longitu

m.fillcontinents(color='green')
m.drawmapboundary(fill_color='lightblue');

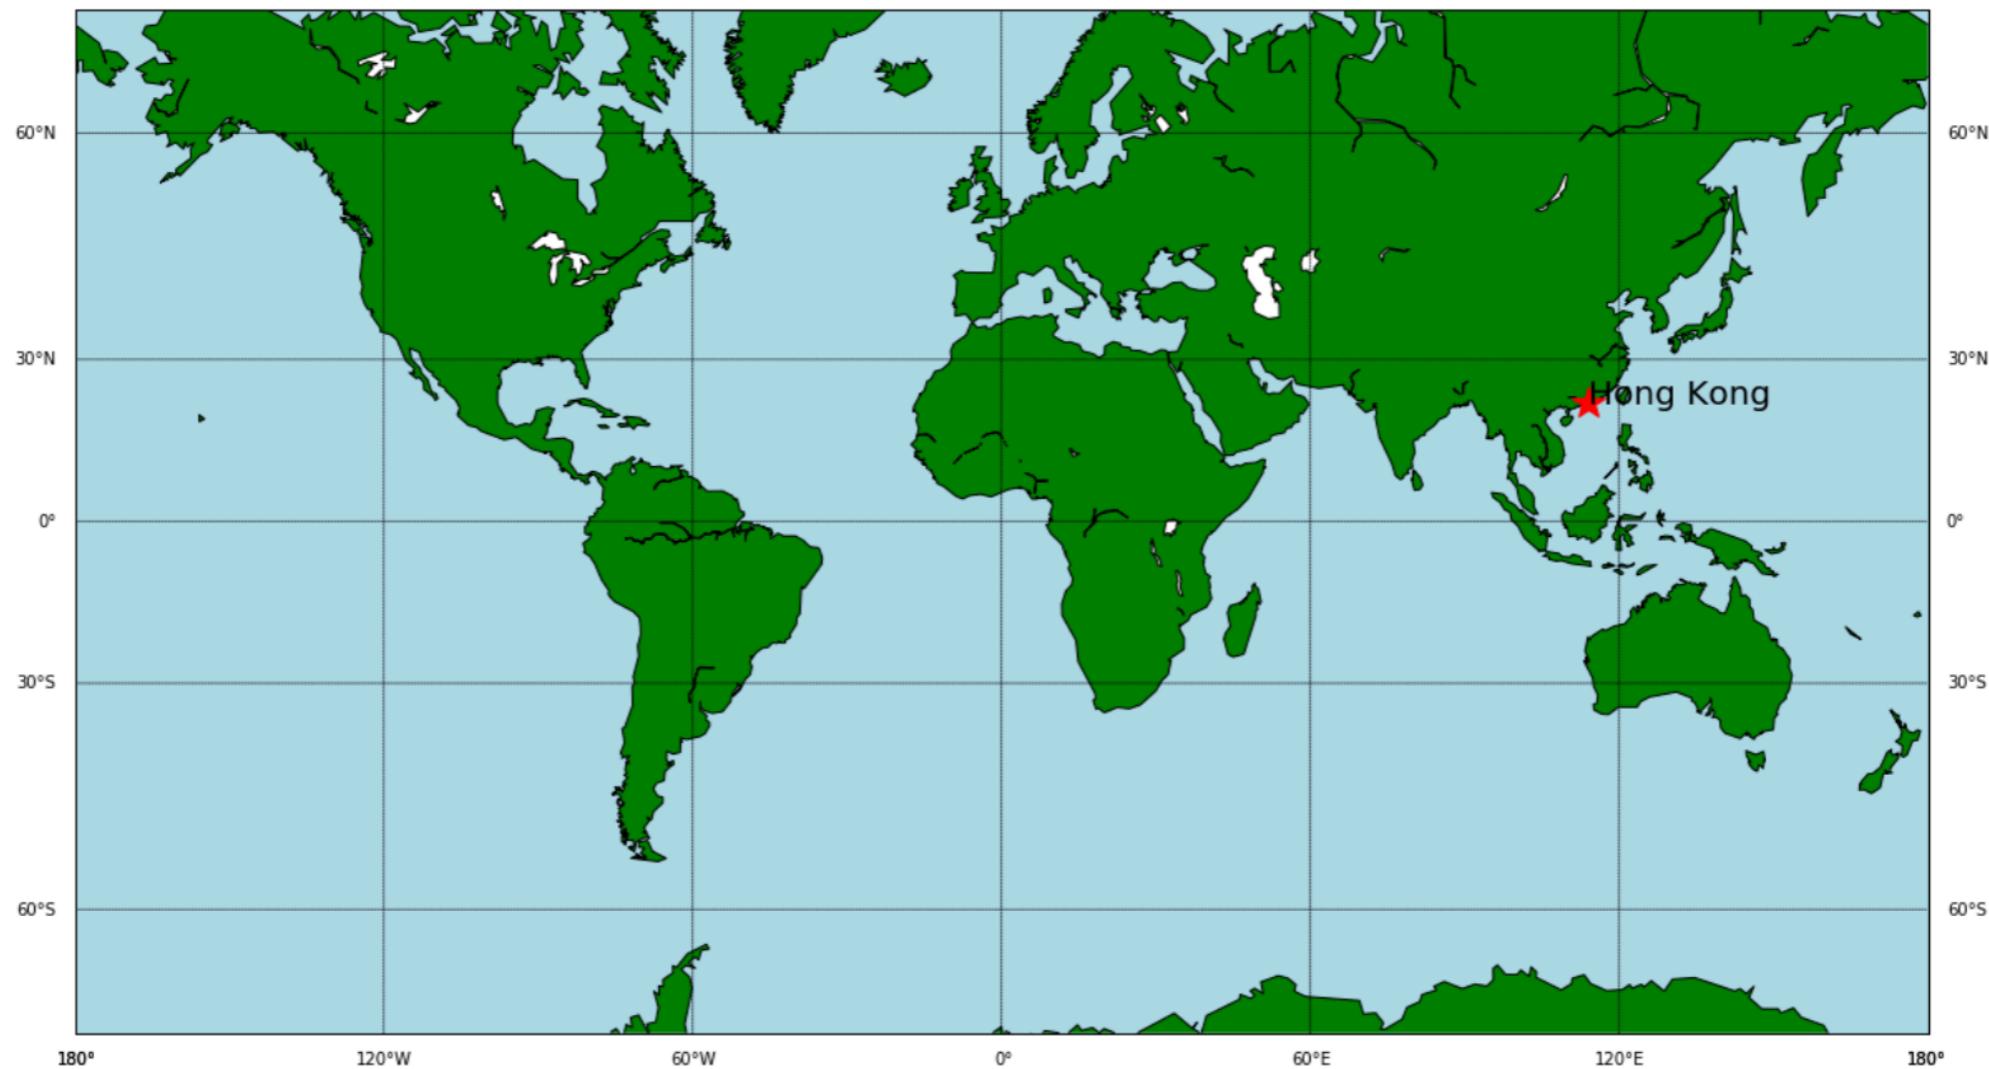

plt.show() # show your map!
```

# Plot data points on your map

```
# set the lat and long of Hong Kong
HK_lat=22.3964 # latitude
HK_lon=114.1095 # longitude
x,y = m(HK_lon, HK_lat) # this will convert the lat,lon info to map coordinates x,y

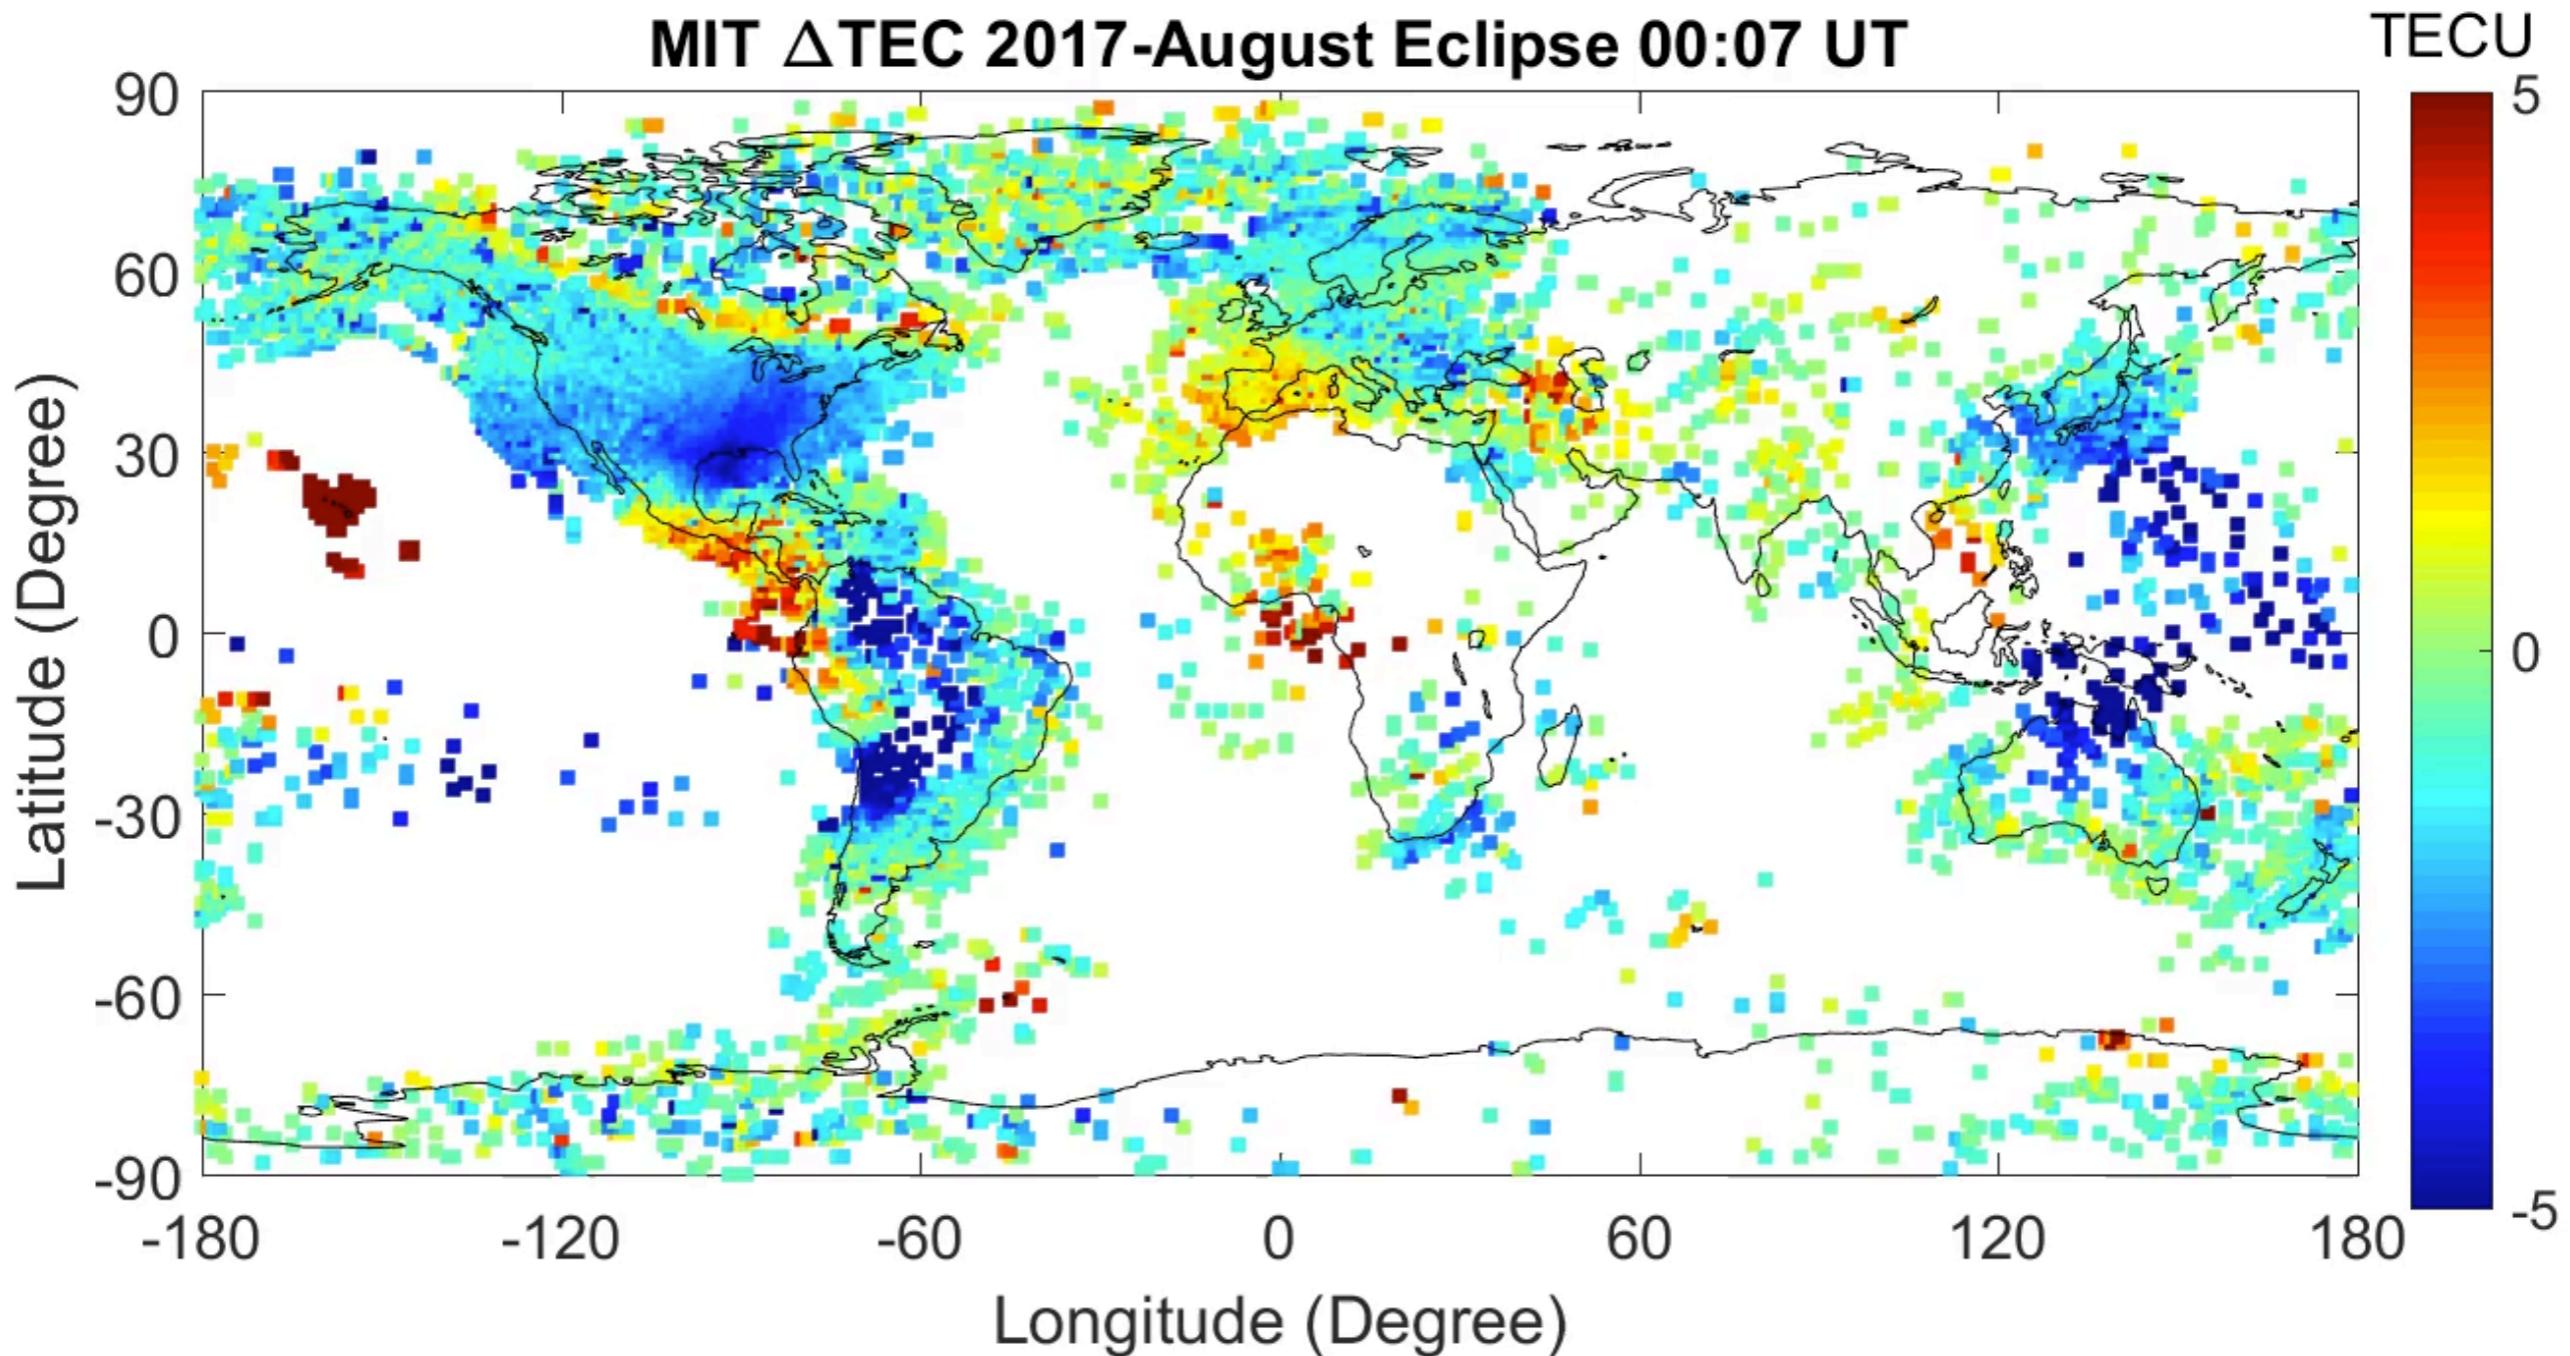

# Plot the location of Hong Kong on your map and annotate it
plt.plot(x,y, 'r*', markersize=20); # markersize sets the size of the marker
plt.text(x,y, 'Hong Kong', fontsize=20) # annotate the marker
plt.show() # show your map!
```

Now you've got your first map created. To make your map more useful, you also want to put something **ON the map**. That's quite straightforward:

- Step 1: take your latitude and longitude (or arrays of them) and **convert them to map coordinates**.
- Step 2: **plot** just like any ordinary matplotlib plot.

# Example of Mercator Projection of Global GPS TEC Maps

# Orthographic Projection of the world map (ortho)

```
plt.figure(figsize=(10,10)) # create a new figure with size (16,15)

m = Basemap(projection='ortho',lon_0=100,lat_0=30)
m.drawcoastlines();

m.drawparallels(np.arange(-90.,91.,30.))
m.drawmeridians(np.arange(0.,361.,60.))
m.drawmapboundary()

m.fillcontinents(color='orange')
m.drawmapboundary(fill_color='lightblue');

# set the lat and long of Hong Kong
HK_lat=22.3964
HK_lon=114.1095 # takes the longitude and converts to 0=>360
x,y=m(HK_lon,HK_lat) # this will convert the lat,lon info to map coordinates
plt.plot(x,y,'r*',markersize=20); # markersize sets the size of the marker

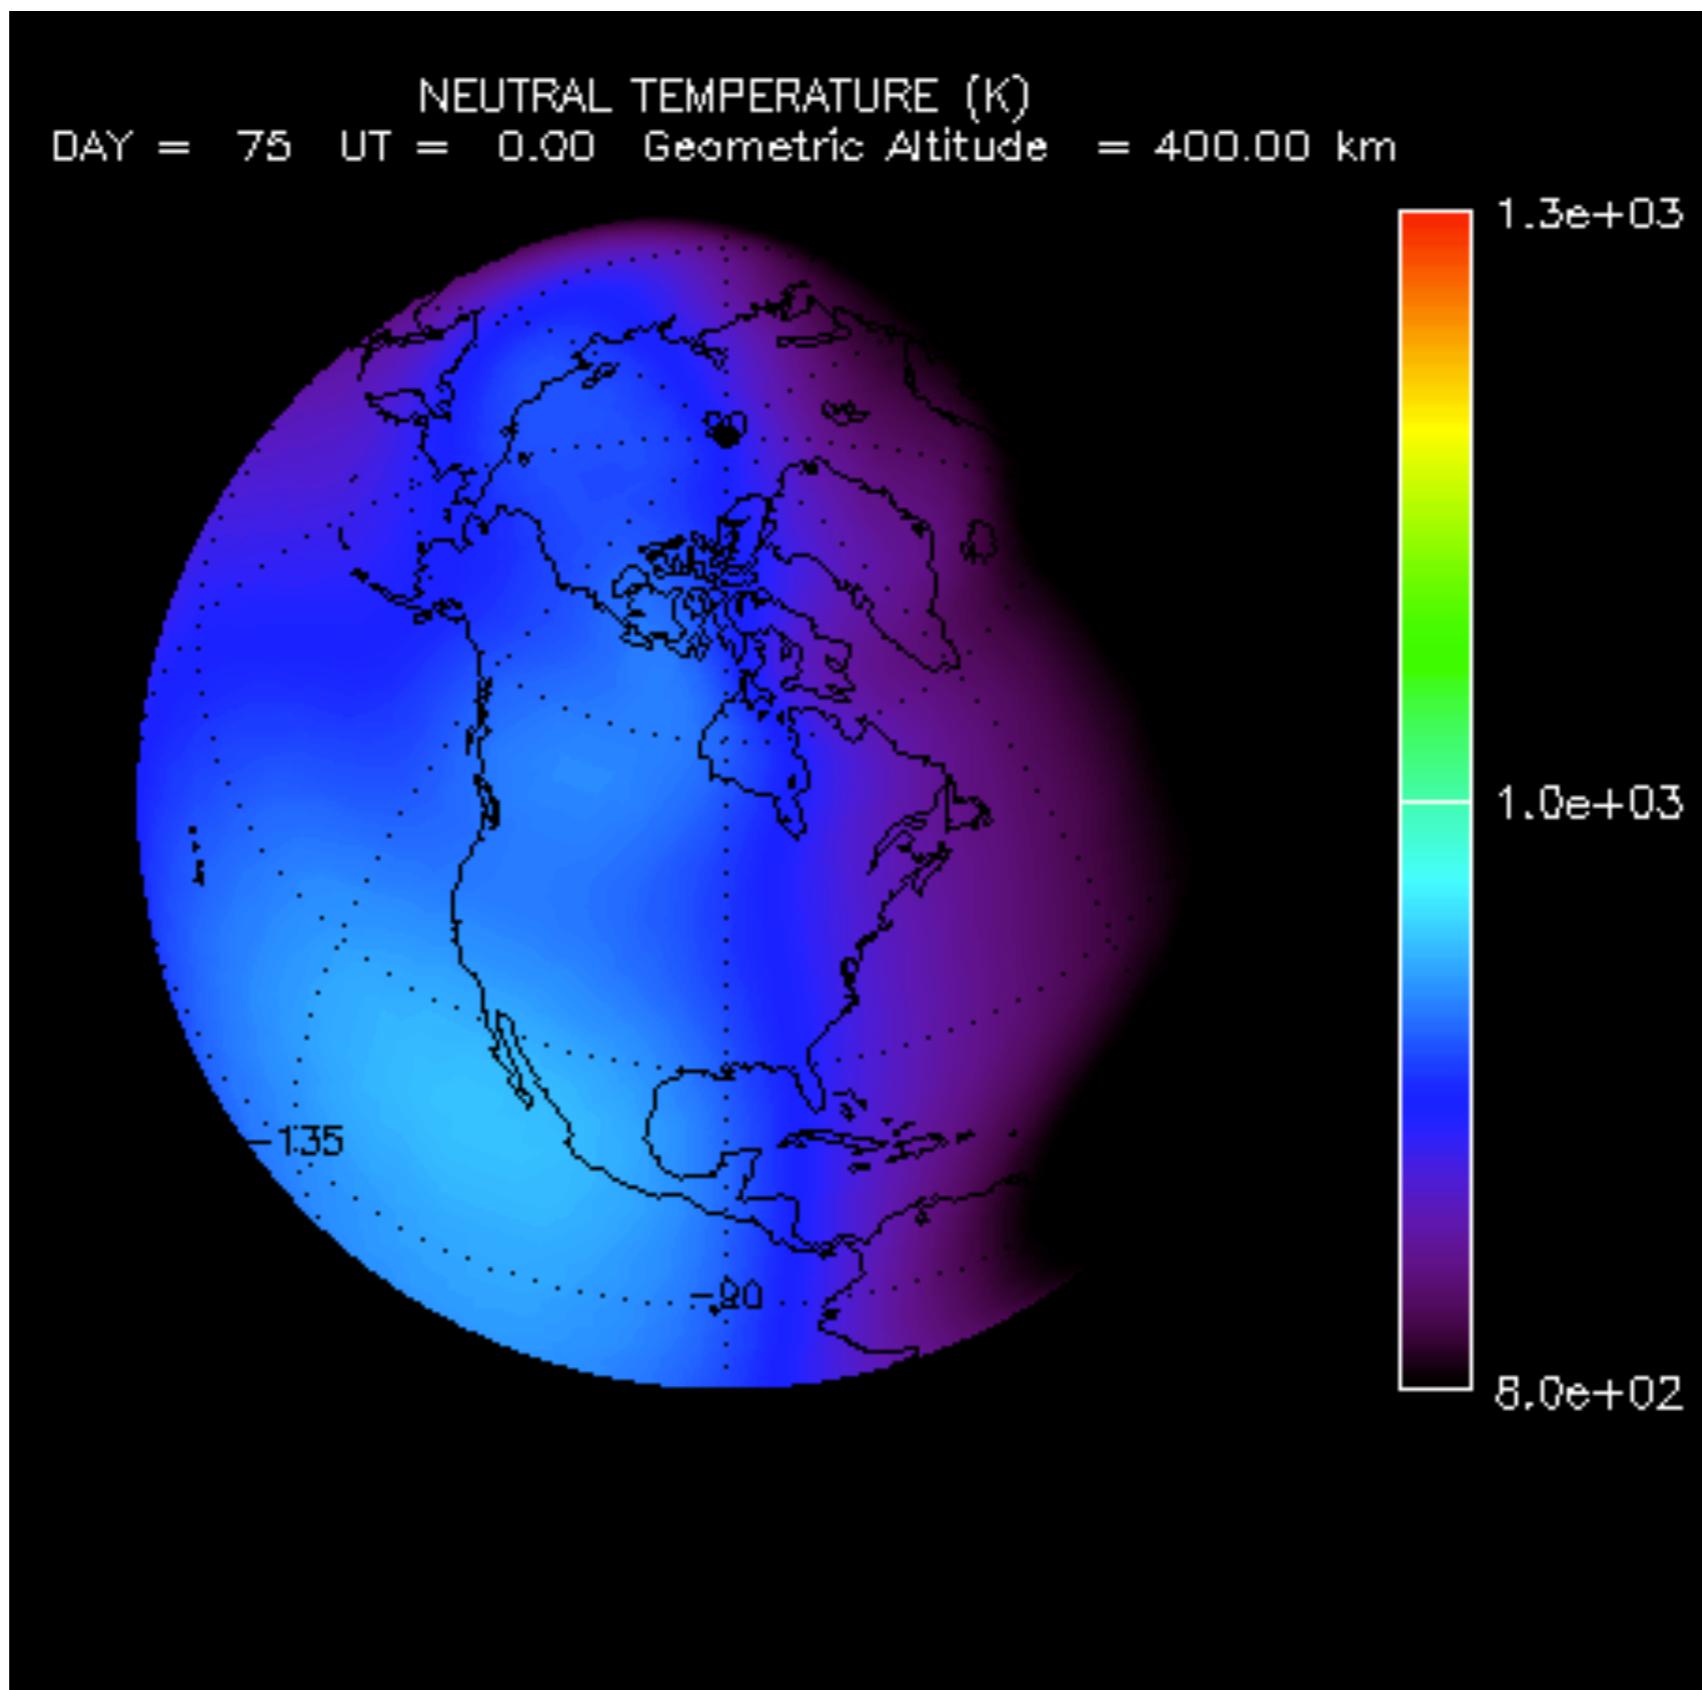

text_lat = HK_lat
text_lon = HK_lon + 3 # let's shift the text annotation 3 degrees eastward
text_x,text_y=m(text_lon,text_lat) # this will convert the lat,lon info to map coordinates
plt.text(text_x,text_y,'Hong Kong',fontsize=20) # put on the text annotation

plt.show()
```

The Mercator is a nice classical map, but it sure does distort the map at high latitudes.

Another type of map projection is the orthographic projection which is much less distorted. The downside to this projection is that you cannot see the whole globe at once. To create an orthographic map, you initialize a map instance with the projection '**ortho**' and arguments **lon\_0** and **lat\_0** - the central longitude and latitude- instead of the lower left/upper right corner syntax.

## Example of Orthographic Projection of global upper atmosphere

# Hammer Projection (hammer)

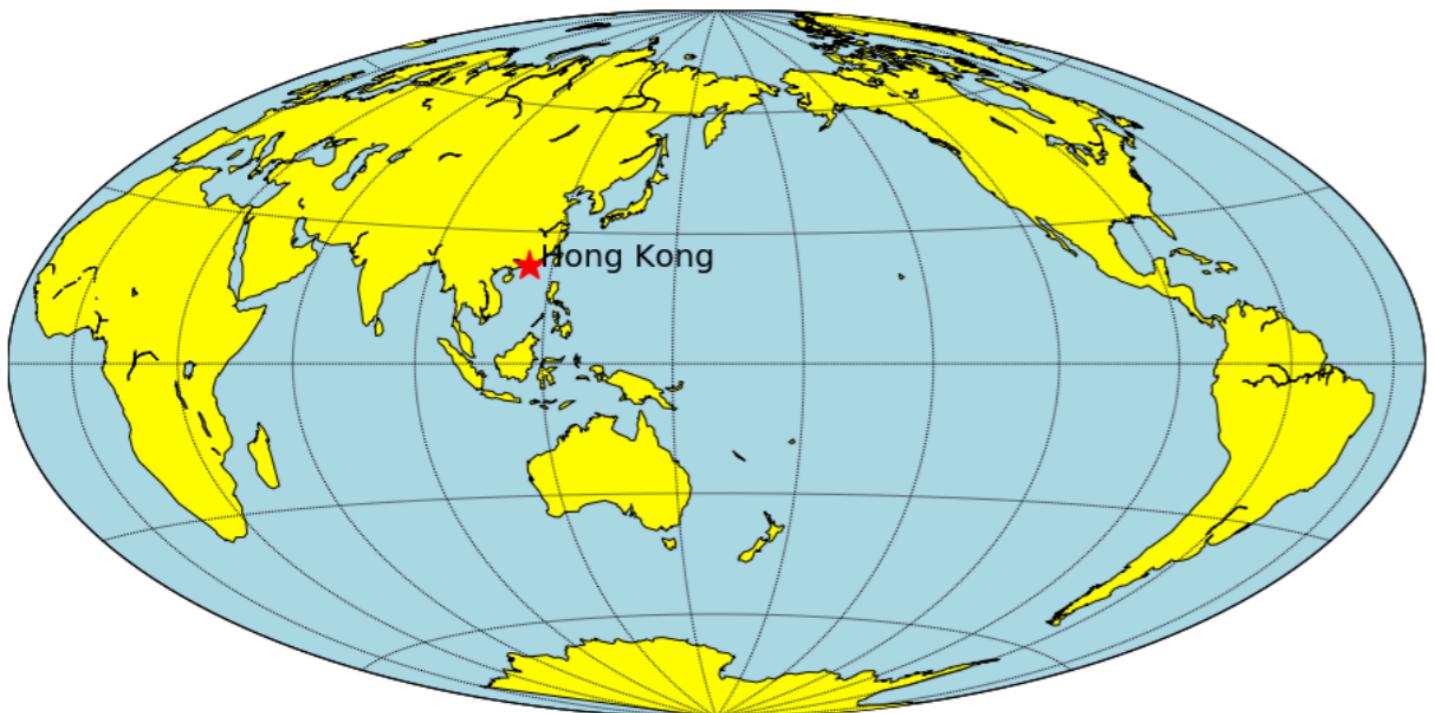

```
plt.figure(figsize=(16,10)) # create a new figure with size (16,15)

m = Basemap(projection='hammer',lon_0==200) # make a Hammer map object
m.drawcoastlines()
m.fillcontinents(color='yellow',lake_color='lightblue')
m.drawparallels(np.arange(-90.,120.,30.))
m.drawmeridians(np.arange(0.,420.,30.))
m.drawmapboundary(fill_color='lightblue')

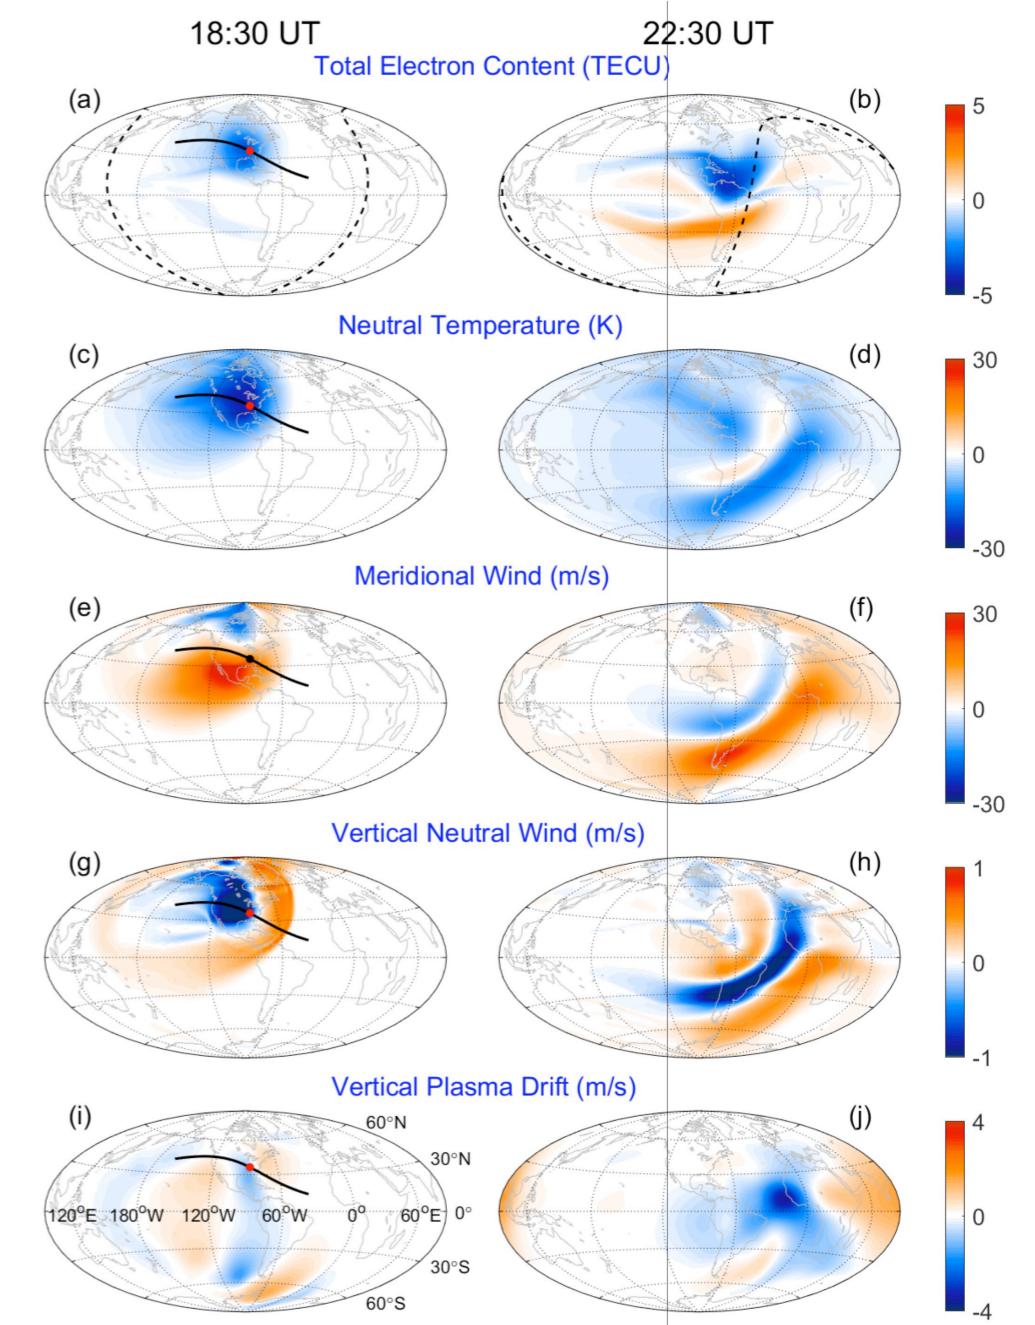

# set the lat and long of Hong Kong
HK_lat=22.3964
HK_lon=114.1095 # takes the longitude and converts to 0=>360
x,y=m(HK_lon,HK_lat) # this will convert the lat,lon info to map coordinates
plt.plot(x,y,'r*',markersize=20); # markersize sets the size of the marker

text_lat = HK_lat
text_lon = HK_lon + 3 # let's shift the text annotation 3 degrees eastward
text_x,text_y=m(text_lon,text_lat) # this will convert the lat,lon info to map coordinates
plt.text(text_x,text_y,'Hong Kong',fontsize=20) # put on the text annotation

plt.show()
```

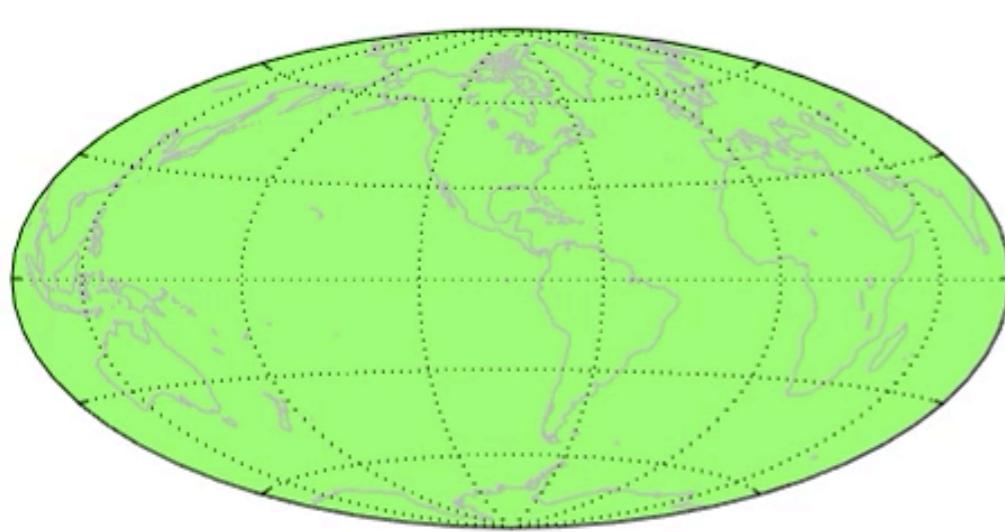

One more global scale example of a map projection is the Hammer projection (one of the most popular). This is always a global map centered on the equator, so all you need to specify is the central longitude (with the **lon\_0** argument).

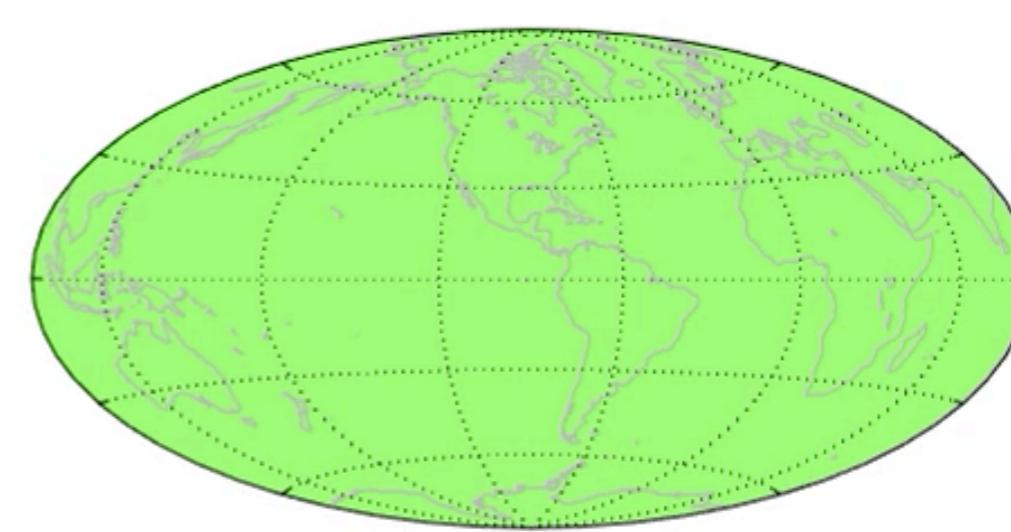

# Example of Hammer Projection of global upper atmosphere during eclipse

15:01 UT, Aug 21

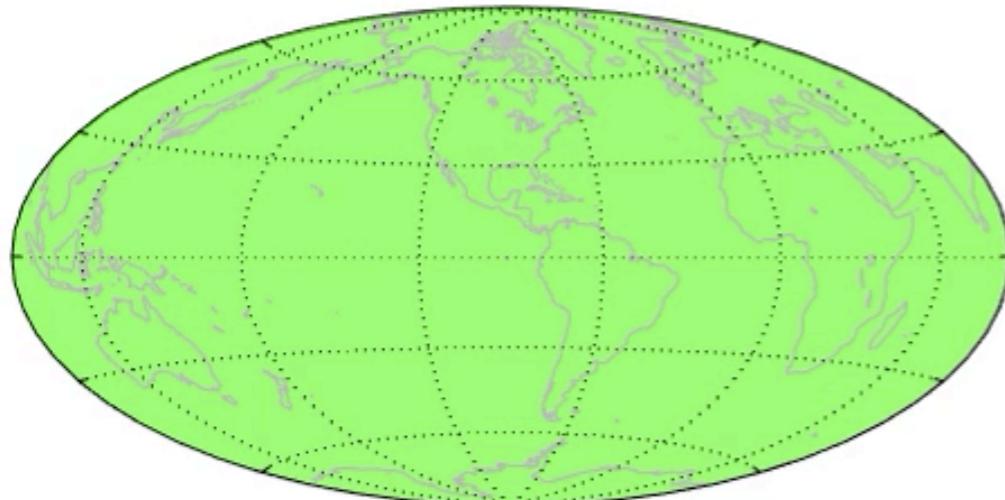

(a)  $\Delta \text{TEC}$  (TECU)

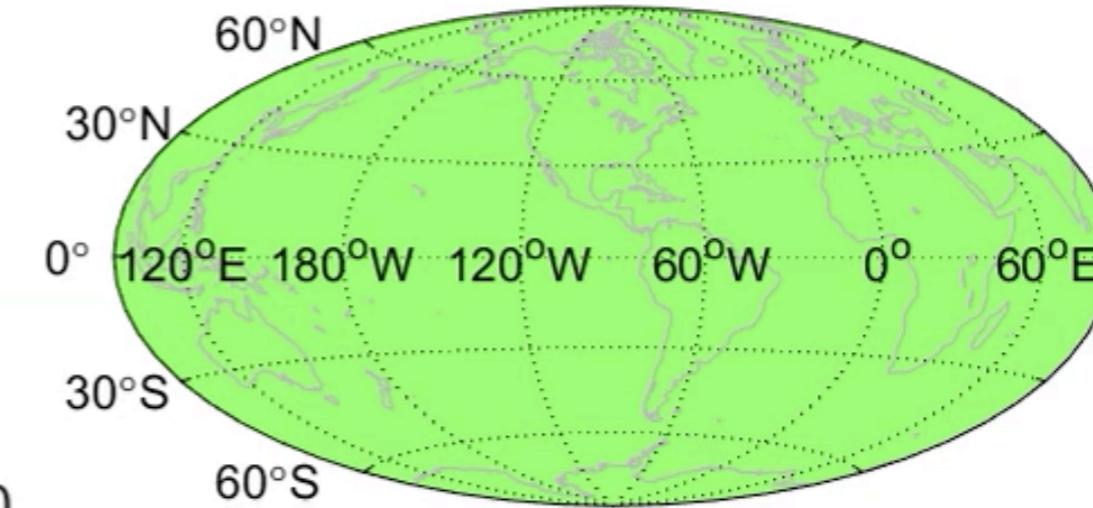

(b)  $\Delta T_n$  (K)

(c)  $\Delta V_n$  (m/s)

(d)  $\Delta W_i$  (m/s)

# Lambert conformal conic projections (lcc)

```
plt.figure(figsize=(20,15)) # create a new figure with size (16,15)

# make a map instance called 'm', pay attention to the boundaries of the map
m = Basemap(projection='lcc',llcrnrlat=10,urcrnrlat=53,llcrnrlon=77,urcrnrlon=140,lat_0=23,lon_0=104,resolution='l')
m.drawcoastlines(); # put on the coastlines

m.drawparallels(np.arange(-90.,91.,10.), labels=[True,True,False,False]) # plot the latitudes (parallels) from -90 to +
m.drawmeridians(np.arange(-180.,181.,10.),labels=[False,False,True,True]); # same for longitudes (meridians) but with 6

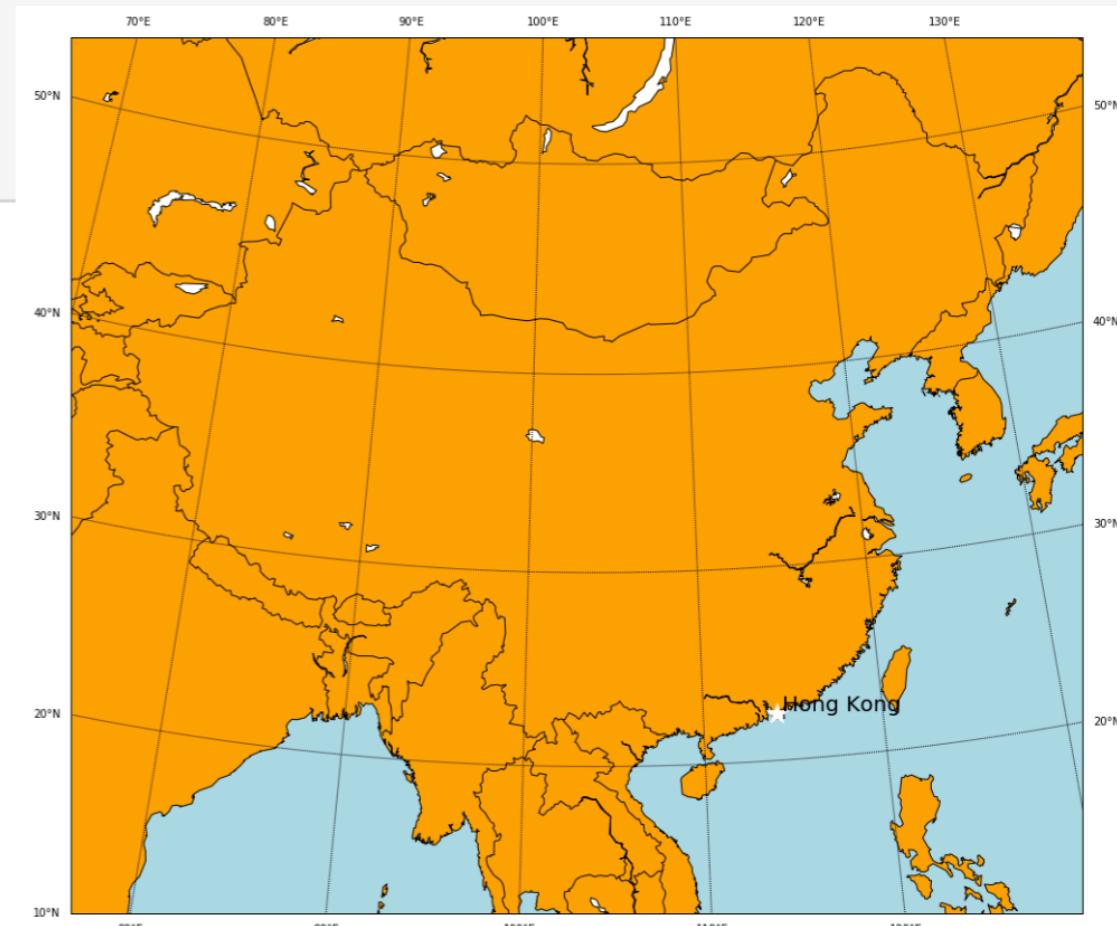

m.fillcontinents(color='orange')
m.drawmapboundary(fill_color='lightblue');
m.drawcountries(color='black',linewidth=1)

# set the lat and long of San Diego
HK_lat=22.3964
HK_lon=114.1095 # takes the longitude and converts to 0=>360
x,y=m(HK_lon,HK_lat) # this will convert the lat,lon info to map coordinates x,y
plt.plot(x,y,'w*',markersize=20); # markersize sets the size of the marker
plt.text(x+30000,y+20000,'Hong Kong',fontsize=20,color='black')

plt.show() # show your map!
```

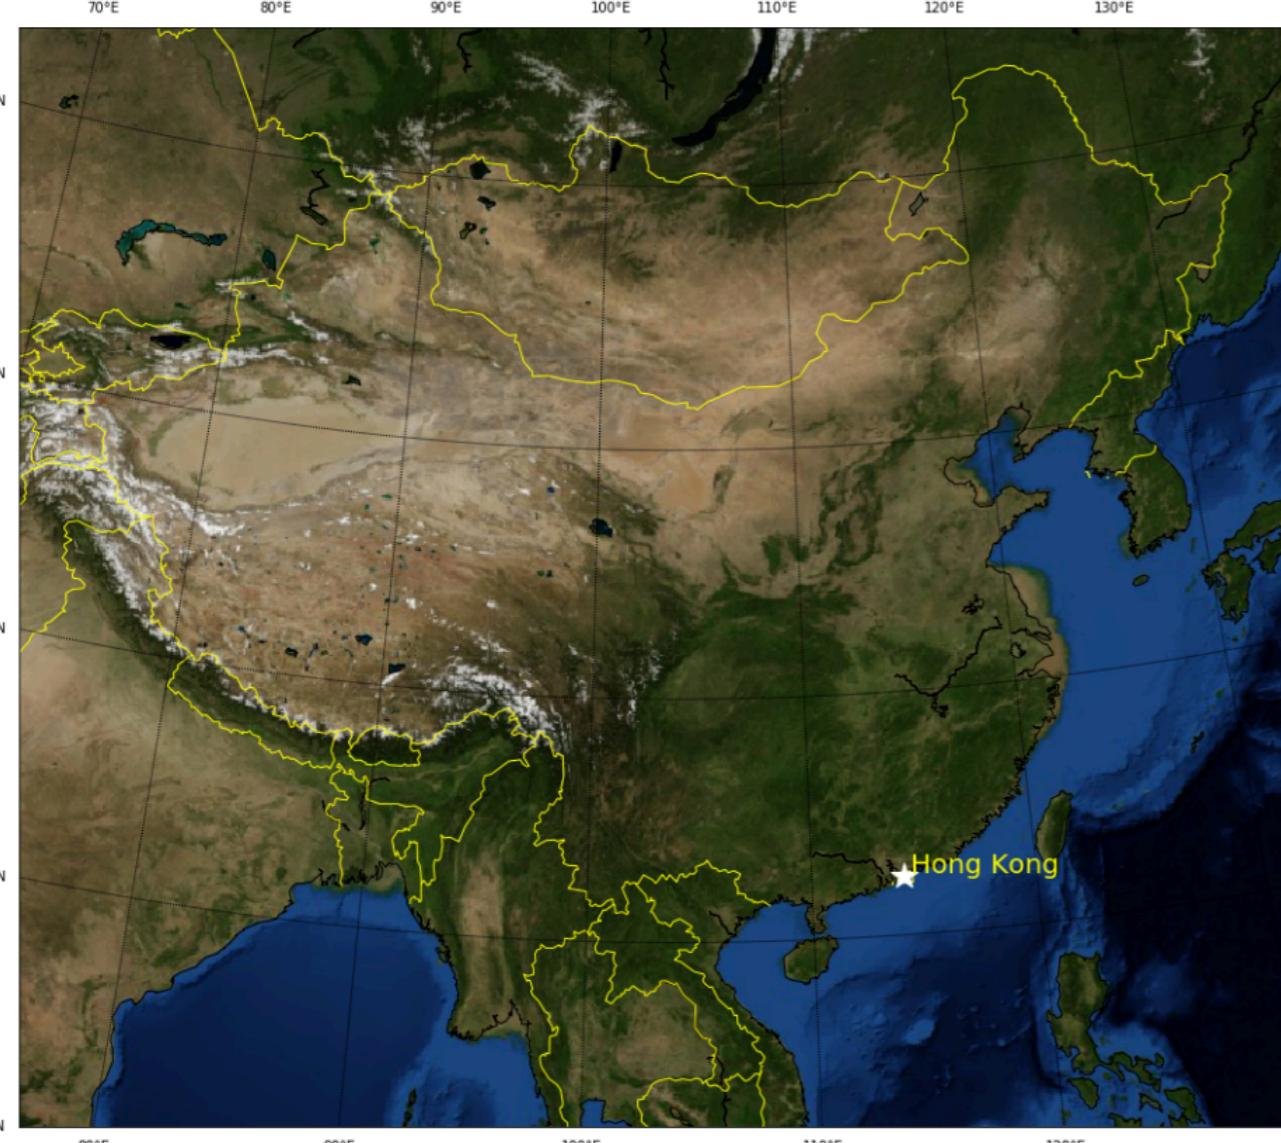

## Function/options used:

projection = 'lcc'  
llcrnrlat, urcrnrlat, llcrnrlon, urcrnrlon  
fillcontinents()  
drawmapboundary()  
drawcountries()

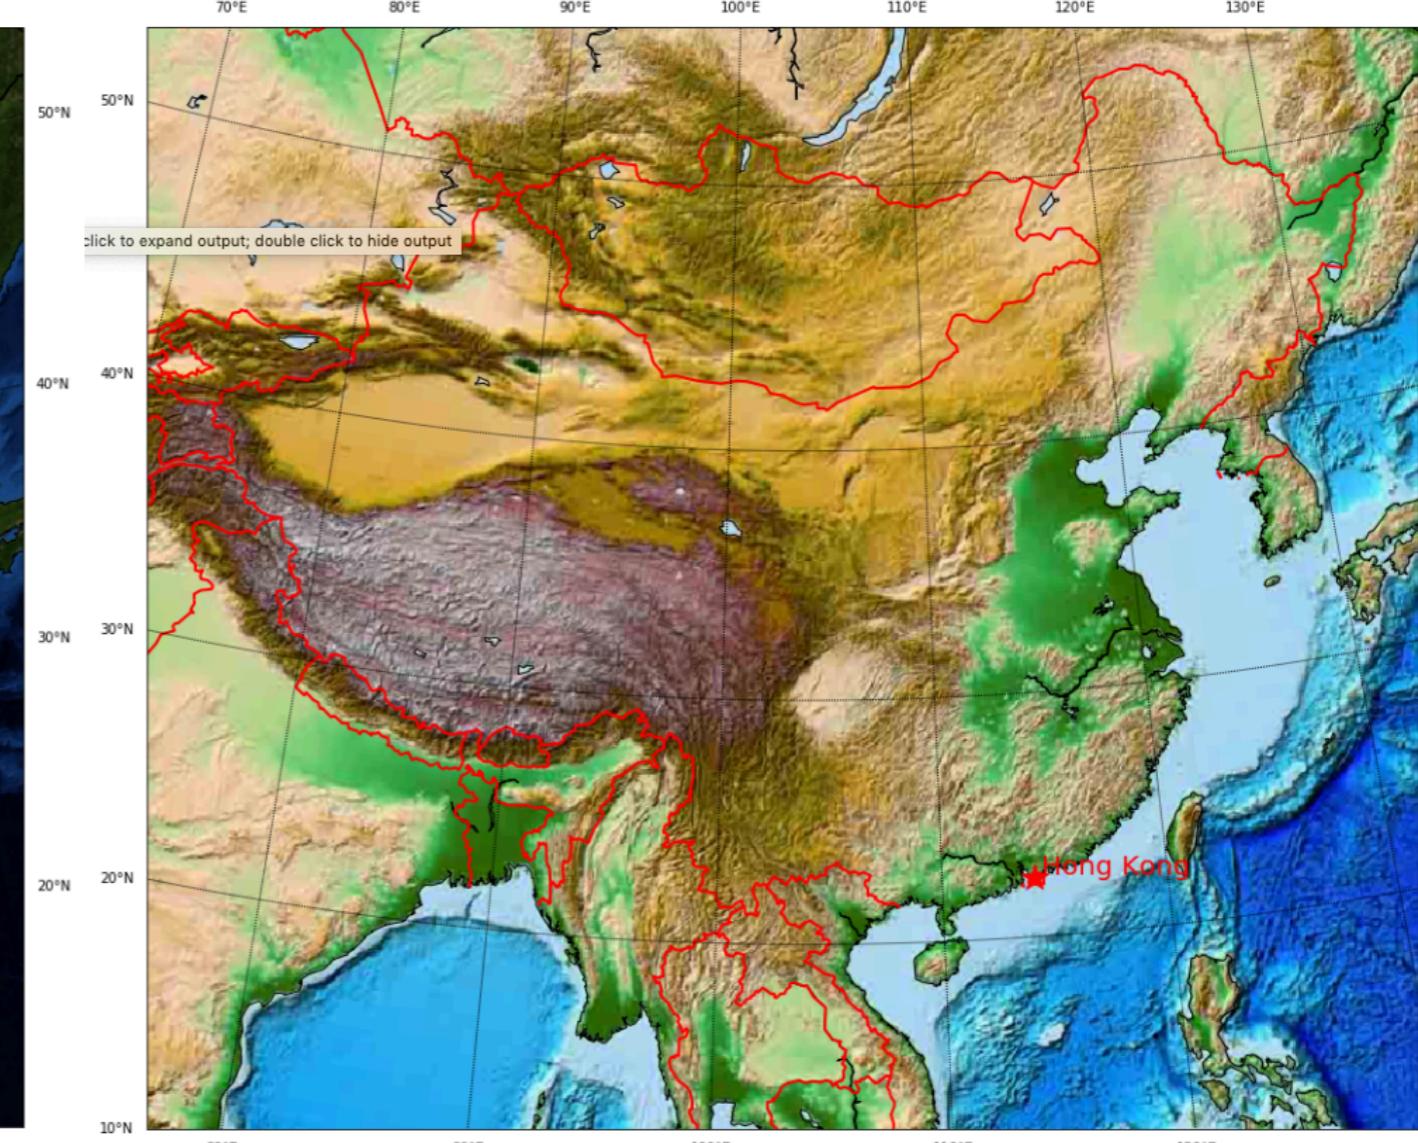

## use the bluemarble() and etopo() view

```
m.bluemarble() # NASA's blue Marble image
```

```
m.etopo() # NASA's
```

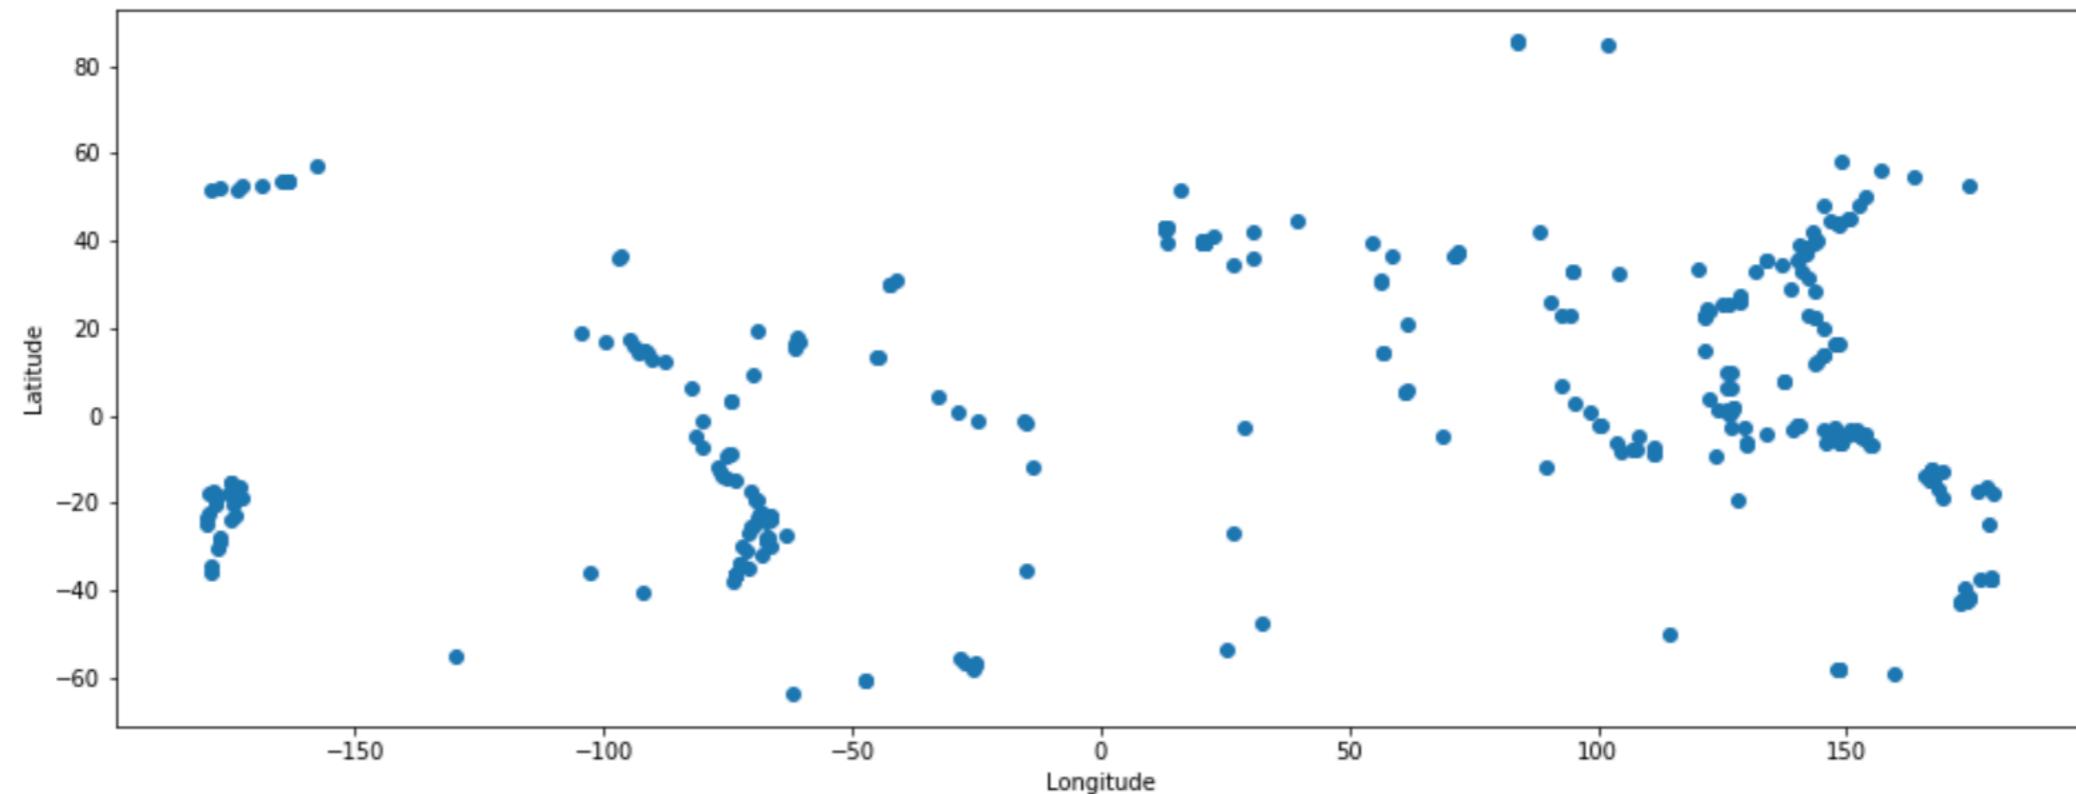

The lcc projection is the most popular projection for **local** maps

## Now let's do science

Recall the earthquake data sets we looked yesterday, plotting the locations of earthquakes on a lon-lat figure gives the following scatter plot:

```
In [21]: EQ = np.loadtxt('datasets/earthquake.csv', delimiter=',')  
  
lat = EQ[:,0]  
lon = EQ[:,1]  
dep = EQ[:,2]  
mag = EQ[:,3]  
  
plt.figure(figsize=(16,6))  
plt.scatter(lon,lat)  
plt.xlabel('Longitude'), plt.ylabel('Latitude')  
plt.show()
```

**Everything is correct, but does the plot make sense?**

## Now put everything together

Now let's put the global map (Mercator projection of the globe) together with earthquake data points:

```
In [26]: EQ = np.loadtxt('datasets/earthquake.csv', delimiter=',')
disa = EQ[:,3]>7.5

lat = EQ[:,0]
lon = EQ[:,1]
dep = EQ[:,2]
mag = EQ[:,3]

plt.figure(figsize=(16,6))
m = Basemap(projection='merc',llcrnrlat=-60,urcrnrlat=60,
            llcrnrlon=-160,urcrnrlon=200) # make a map instance
m.drawcoastlines(); # put on the coastlines
m.drawparallels(np.arange(-90.,91.,30.), labels=[True,True,False,False]) # plot the latitudes
m.drawmeridians(np.arange(-180.,181.,60.),labels=[False,False,True,True]); # same for longitude
m.fillcontinents(color='orange')
m.drawmapboundary(fill_color='lightblue');

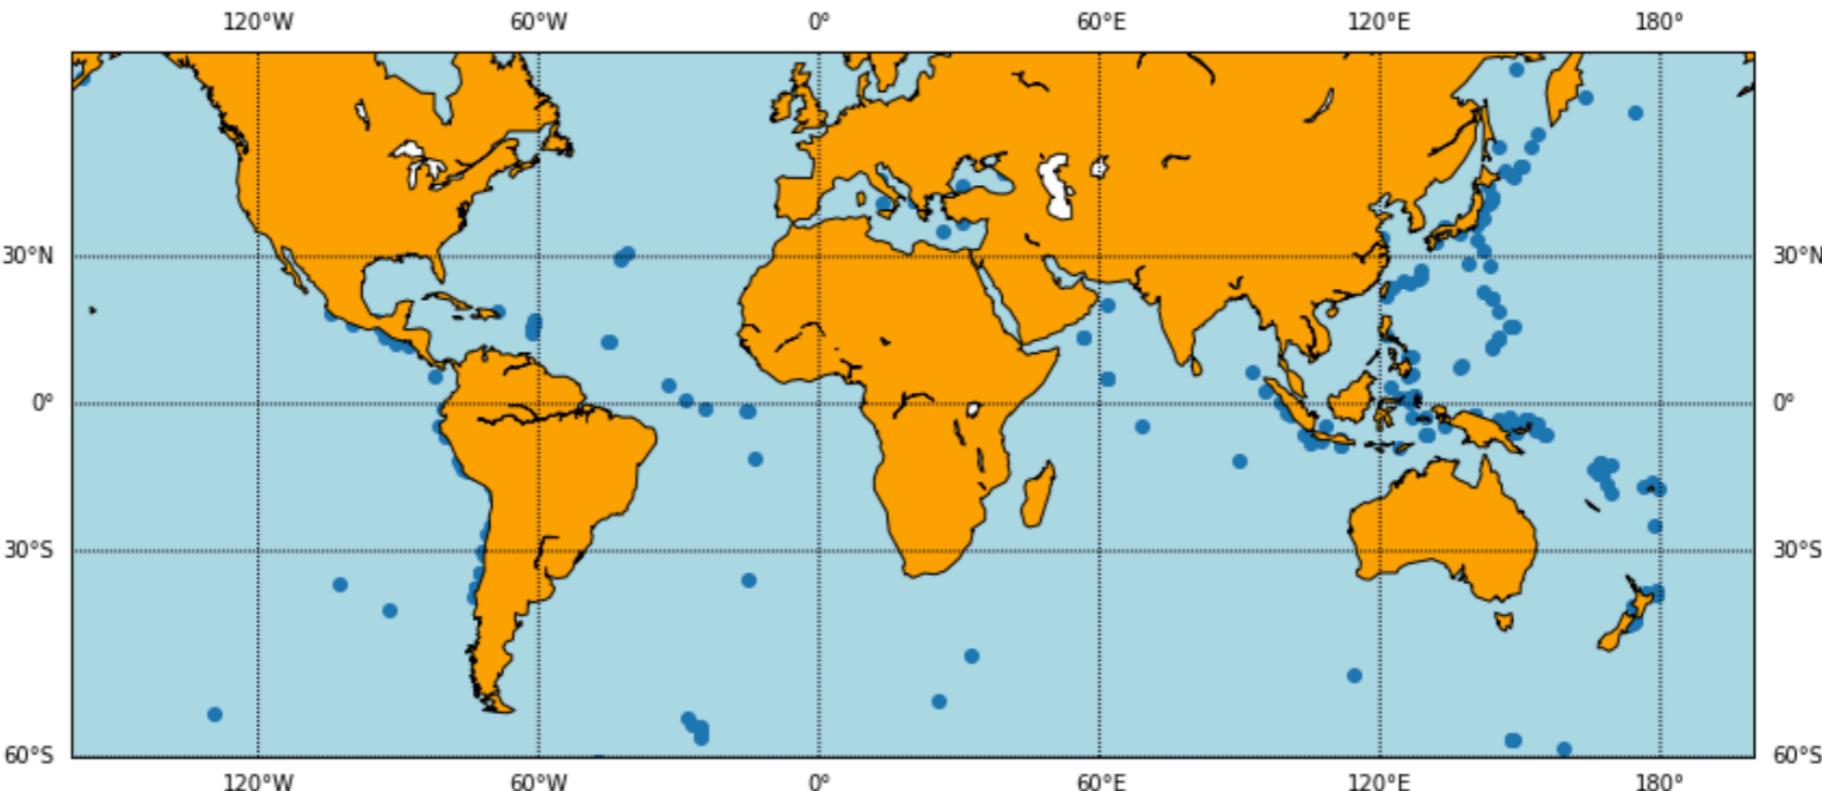

x, y = m(lon,lat)
plt.scatter(x,y)
plt.show()
```

load data

Slicing 2-D array

Map! 'm'

Plot data

**Now let's make maps!**
